Short answer is yes, there's a mistake in some of the original
literature that had the dial going the wrong way.  Its been a while so I
can't recall the specifics but it sounds as if you know the way to go
with it.

     Now I am confused, what is the "right" way?  Should the
dial string cross over at any point? on the stuff I have
from the web its not shown that way.

Is that the same as the S-40 (with out the A)? If so there is a stringing diagram here on page 4:
http://www.nostalgiaair.org/PagesByModel/867/M0008867.pdf

I hope this helps.

Have the following original Collins mauals available:

KW-1 transmitter

KWS-1 transmitter

KWM-1 transceiver

75A4 receiver

KWM-2A transceiver

62S-1 transverter

Manuals are in excellent condition. Some may have the original owner's name on the front cover. E-mail me off list with a resonable offer for each.

Tnx & 73

My stuff snipped....

I think I have that info. All the service information I can
find on the web shows straight dial stringing but I have had
two replys indicating that some S-40 series require crossed
stringing. There must have been some manufacturing error or
change at some point but that info is probably lost. I will
change the stringing on my RX since I don't think I can get
the stop peg out without damaging the cap.

I really don't see why you have a problem. All the bandspread cap does is finetune a space around the center freq. To use it correctly, you leave it set at 50, and then you can finetune either up or down. The stringing will only affect which side is up or down. Obviously, you want less than 50 to be down, so string it so it gains capacitance (lowers frequency) as you tune down.

I think you don't understand the function of bandspread. Even though this is not a calibrated bandspread it does have definite position it must be in for the main dial to be calibratable. For most Hallicrafters receivers that is 0 on the dial representing minimum capacitance for the band spread capacitor. The main dial will not calibrate at any other value of capacitance. The trouble is that you are suggesting a sort of makeshift which would prevent the radio from working properly. The question is why was the capacitor made in such a way that it could not work properly if the dial stringing instructions for the receiver were followed and why some receivers of this model are one way and some another. Tha last two questions are probably beyond answering. Its possible that some person wanted the bandspread dial to start at 100 as it does for other brands of receivers and delibrately changed the position of the stop peg on the capacitor so that it rotates the wrong way. Its also possible there was some change made in production although I doubt that. In any case, since I have been unable to knock the peg out to replace it the other way. I will restring the dial system to reverse the rotation of the band spread capacitor. That will have the cap at minimum value when the dial indicates zero. The dial says on it to set at 0. So, even though I could simply calibrate it with the dial at 100 the markings would mislead someone else trying to use it.

While makeshifts are sometimes necessary I really hate having to use them. Even the crossed stringing is a makeshift but I am afraid of damaging the capacitor and making the whole thing unusable if I apply too much force in trying to remove the stop peg.

Hello Richard:

I think I know what the problem is - but this is only a guess. Both you and I have S-40A receivers where the bandspread capacitor has the lockout pin on the wrong side of the retaining plate. They both appear to be factory jobs, and the problem is that the receiver cannot be calibrated correctly.

In all cases, the restringing technique is the same for the S-40, the S-40A and the S-40B.

I think the only logical conclusion is that Hallicrafters received a number of capacitors that were manufactured defectively. They may have made them themselves, which means that they would waste the money in remaking them. Or, if a sub-contractor did it, they may have received a substantial price break. In either case, Hallicrafters made the conscious decision to use these defective capacitors and save money.

By stringing these capcaitors like you suggest, everything will operate normally. And, there will not be a problem for years - or ever. I suspect that in both of our receivers, the bandspread string broke and required restringing. In both cases, the restringer strung it just as the service instructions specified - which is why they do not work correctly. Since the original change could not be observed (because the original string was broken), the restringer would not know of the problem.

I think your solution is the only reasonable one. I suppose we should put a note inside the receiver, so that in 30 years, when the string breaks again, the same issue will not arise once more.

Perhaps we could put our S-40A receivers on eBay and advertise them as unique or rare.

Glad you posted this, as I was beginning to think I had simply been working on old radios far too long.

73, Colin K7FM

Also, I expect some bearing may be missing on your capacitor because someone tried to "fix" it by the brute force method.

I was tempted to try the same method.

I have for sale a Henry 2KD Classic Desktop HF Amp in beautiful condition for $1075. The amplifier has 10 meters installed and comes with the original manual. It has a pair of full output Eimac 3-500Z tubes and is setup for 220 volts. I can send digital pictures upon request. Due to the weight of the Amp, I would prefer a pick-up in Abilene, Texas or could deliver to the Midland or Weatheford, Texas Hamfest in March and April. Thanks, Charlie Hugg, K5MBX

I was able to find the right bearings (1/8th inch BTW) locally and replaced the missing ones. I crossed the string to the main pully and it works fine. However, I rather wonder if someone in the dear dead past may have written an artical suggesting a mod to make the band-spread dial run from 100 down as it does on many other receivers. Hallicrafters seems to have chosen to make their dials indicate relative capacitance, or, perhaps wavelength. Mine didn't need a new dial string, the original was there but the spring on the pully was gone and the string was just lying there. I was able to make a spring but cutting down a standard spring from the hardware store. When threaded as shown in the handbooks the string is just right, when crossed over its just a bit short but I could still use it.

I rather wonder if someone perhaps published a mod for these receivers to make the band spread dial run the way it does in most other brands of receivers, i.e., 100 being the set point. The dial would then make sense in terms of frequency change, i.e., higher numbers indicating higher frequencies. I have no idea why Hallicrafters chose to number their band-spread dials oppositely, but they did. I may still try to remove the peg by drilling it out but I have other work to do on this guy so that will have to wait. Lots of caps to replace plus the power switch gave up the ghost tonight. I opened it and one of the little tabs was broken off. Perhaps I can find a replacement but, for the moment, I will probably mount a snap switch in the line cord (which I have to replace anyway. I think this RX has had a long and hard life and deserves some TLC at this point.

I've got a receiver that has no identifiable markings and I wonder if anyone can assist me in learning what it is?

The receiver can be viewed at

http://img.villagephotos.com/imageview.aspx?i=24536290

It is 10-inches wide, 8-inches deep and 8-inches high.

It contains two tubes and I presume it to be a regenerative. The two tubes are a 6J5 and a 6J7. Since the receiver has such a cloak of mystery surrounding it, I have no way of knowing if those were original tubes or substitutions. The 6J5 may very well have been a substitute for an original 6C5. The 6J7 may have been a substitute for a 6W7.

At first I believed the receiver to be a derivation of either a National SW series or possible a homebrew Frank Jones regen. However the die cut of the cabinet and extrusions are too professional to be a homebrew nor does the wiring job underneath suggest a factory made unit.

The two pointer knobs were on the receiver when I bought it although, to me anyway...they look too modern for the rest of the vintage of the receiver. Band is selected with a plug in coil. The coil that was included was homebrewed and without marking.

The style, circuit and tube choice suggests a vintage of very late 1920s or 1930s era.

If any of you have any ideas or guesses I would welcome them. Thanks.

WA9VLK

Check all the screws and nuts used in the device. If they are all
identical in size, length, thread, and the nuts are all identical,
then chances are it is a commercial unit, but made by a small company.
Varying nuts and screws are sure sign of home brew!

Can anyone help?
I am looking for a FNB-70 battery pack for the Yaesu FT70G HF Manpack.
Even a non-functional unit would suffice, as I can replace the rechargeable
cells inside.
Any assistance would be greatly appreciated.

The electret elements from Radio Shack include an amplifier, which is why you have to power them; but I don't know if it brings the output level up to that of a carbon mike. The electret T-1 replacement I got from Mike Sandman obviously has enough amplification built into it somewhere, since it directly replaces the T-1. But I didn't tear it up to see what is inside.

All those electret elements have a FET-IC in them, which is a J-FET with
controlled leakage so that they don't need a grid leak resistor inside them.
Apply voltage across them through a resistor, pick the modulated signal
off through a capacitor.  With a little tinkering with series and shunt
resistances you can make one fit right in place of a carbon element.

I thought they stuck with the same IF through the SB line. Or maybe
there was a shift, I seem to recall an article in QST where someone
changed the filter in an early Heathkit SSB transmitter and they had
to make some changes because the then current IF frequency was somewhat

different.

For AM, there's probably a lot more possibilities. Pull some ceramic filters out of a CB set and cascade them, though those will be at 455KHz. All kinds of cordless phones, cb sets, some older cellphones, 49MHz superheterodyne walkie talkies and other consumer items use double conversion, with the first IF at 10.7MHz (and a wide ceramic filter there, the type you find in FM broadcast band receivers) and then a conversion to 455KHz, so they'd supply the needed crystal for the second conversion.

If you're not stuck on a specific IF frequency, there's bound to be still lots of AM bandwidth crystal filters floating around, since after all relatively few were interested in good filters for AM, while SSB-width filters were very desired.

Digi-Key stocks a number of ceramic and crystal filters that might be suitable for AM reception for less than $10 each, some for less than $2. They are willing to sell in small quantity and are one of the better distributors of electronic parts. Now one of the largest distributors, they got their start selling kits of parts for an integrated circuit keyer for hams. See:
http://www.digikey.com/.

Very interesting, gentlemen. I'm going to have to give this a try as
I've, heretofore been using the element tken from H-33/PT handsets and
those old single-headest PBX operator's units. Might either of you have
the part numbers? I fear, also, that RatShak may well have deleted this
item as they have hundreds of other components.

It _might_ be possible to shift the frequency of an existing ceramic filter
up somewhat by judicious file and sandpaper work. I am not sure how much
you can cut it before you screw the geometry up too much for it to work,
though.

If you need a weird frequency like this, though, I would first call ICM
and see if they can make you something at a reasonable price. They have
standard crystals for very cheap and I bet they won't charge much for
filter crystals either.

They are all pretty much the same other than polarity... you can grab any
cellphone headset or computer headset from the dollar store and use that.

If you want a nice electret element, try the Panasonic WM-61A, Digi-Key
part number P9925-ND.  It's pretty small so be careful soldering, but it
is better made and lower noise than most of the cheapies and still only
costs a couple bucks.

You seem to be asking for two different things.

Do you want to homebrew a radio to receive AM, and are looking for some
candidate filters?

Or do you specifically want to build a Heathkit tube rig or use the
Heathkit SSB and CW filters in a rig, and you want an AM filter to match?

If it's the former, then find out who's selling replacement filters (the
name "Fox Tango" floats up to my consciousness) and see what they have.

If it's the latter -- well, the same place may have what you want, or you
may be out of luck (did the Heath rigs _have_ an AM selection? Mine
certainly didn't), or you may have to mix to some other frequency (i.e.
455kHz), filter, and mix back. Note that my SB-201 didn't have an AM
detector, either, so it may be more than just a filter that you need.

If they kept the same IF frequency, and I know the SB line did use something in the 3MHz range, then there was at least one AM filter, for the shortwave band version of the SB series receiver, the SB-313 or something.

There was a Heathkit receiver/transmitter set for AM about the time of their early SSB rigs, same sort of styling as the SSB rig of the time. The era of the Indian names. I don't know whether those used a high IF or used the traditional 455KHz, but if it was the former, they'd surely use the same 3MHz range scheme as the SSB equpment.

I never had a top or bottom cover with mine.  It was mounted in the station
speaker.  This is where most of them were.  The speaker was a very
worthwhile addition to my SB102.

If you wanted to keep the speaker and e-bay the power supply, I could surely
understand that.  No one seems to make good station speakers any more.

My HP-24 supply is for my HA-14 SSB linear amplifier. Cool little
thing, it's a simplified SB-200 with a separated power supply.
They managed to fit the transformer and caps onto the same chassis as
the HP-23 transceiver supply.

I originally did get it in a speaker case, but, I traded it away for
something else...

I believe there was a regular brand rig (Kenwood?) of about that era that
also used the same mixing scheme, and had the same frequency fixed IF, if
not all the same matching impedances.  I can't really recall, though,
other than I was thumbing through a replacement filter catalog and
noticed it because I had the SB-201.

My fuzzy recollection says that 3395 shouldn't be difficult to find. A
check of completed auctions on ebay didn't bear that out. I suppose it
depends on how big of a hurry you're in :)

That sounds familiar, though I can't remember which brand it was either.

I just did some searching, and I was thrown off by the mention of "early"
in the first post.

I was thinking of the Heathkit Commanche as a small receiver suitable
for mobile operation, and it was used in tandem with the am Cheyenne
transmitter. A check shows that receiver used a 3MHz IF. The Mohawk,
which was a full blown receiver, used 1682KHz and then down to 50KHz,
obviously not a standard combination in Heathkit receivers. The HR-20
Mobile SSB receiver used a 3MHz IF too. A quick search doesn't turn
up what IF's the matching SSB transmitters were using, but I assume
they too were 3MHz.

So then Heathkit moved to 3395KHz, and that was pretty standard for a really long time. I think even the HW series of monoband SSB transceivers used the same frequency, though they used multiple crystals rather than prebuilt crystal filter.

It's all relative, but I think of "early" as the pre-SB line, not the SB line itself. Heath kept the SB line going into the seventies, with cosmetic changes but the same basic design.

At 3395KHz, LC circuits won't provide enough selectivity.  You're either
going to have to find a Heathkit filter for sale, which likely is
going to be hard since the SB line was primarily for SSB so the
optional AM filters would be in scarce supply to begin with, or see
if you can get a more recently manufactured filter, assuming those
third party companies have bothered with AM bandwidth filters.

You could have some crystals ground to the frequency, and try making
a ladder filter.  Or get just one, and make one of those old phasing
type crystal filters, which would need loading to get the needed
wide bandwidth, and of course wouldn't provide good skirt selectivity.

You do realize you could do what people did at the time, when SSB-only
rigs starting coming along but AM was still common?  Receive using
the SSB receiver, which will chop out the unneeded sideband and
knock the carrier down so it won't be a bother, and then the signal
becomes SSB inside the receiver where the BFO can properly demodulate
it.

I worked on a National NC-300 a few months ago. It had a conversion from a
coil to a crystal at the second converter stage.
About half way down the page: http://www.ppinyot.com/N/national/national.htm
look for the "Second Converter modification at V3 6BE6" paragraph.
Schematics and FNBs are on BAMA.

The crystal used in the NC-300 is not at your frequency. But a crystal
company should be able to make you one. I purchased Hammarlund specific
crystals from http://www.icmfg.com/ The crystals were about 25 bucks each.

AND the woman that answered the phone is not just a receptionist. She knew
exactly which crystals I needed for the Hammarlund and what overtone and
impedance!!! Not that she is a woman but she knew exactly what the vintage
crystal replacement I needed!

I hope this leads you some where.

Who knows, but likely they have it on computer.

The old crystal manufacturers tended to keep such information around, and
certainly once they had the information because someone had sent it to
them to get a needed crystal ground, they'd surely have kept it. So
after a while, they could just look up the information. If they bothered
to computerize it, then all they'd have to do is type in some search
terms, and out would pop the needed information. That wouldn't require
someone who knew all the details by heart.

But, in such a situation having someone willing and able to properly
fondle the keyboard, then cheerfully tell you what you need to know, is
still better than a snide gum-chewing receptionist!

I try not to undervalue order-takers and such.  Given how much value they
can add when they're on the ball (and how much they can screw up when
they're not), one cannot dismiss them as "just" anything.

Well, we 'hams' often are not the easiest customers to deal with because we 'know' more than the gal on the other end of the phone :) That said, I not so long ago ordered some xtals from JAN and mentioned my old Harvey-Wells TBS-50 and the gal lit up like she knew what I was talking about.

JAN has my business ever since.

Thanks to all who responded. I located a perfect RF ammeter from W4ZCB and have already located a dicey
problem I've been experiencing with a wire antenna.

ICM and JAN are both this way and they are both absolute joys to deal with.
They know what you want, they know how to make it, and they know what a
fair price is.

For crystals, try MH Electronics, Rancho Cucamonga, CA. Been using them
on MIL rigs, many with some pretty high currents. So far, 100%. They
say they use large blank crystals for their HC-6-style units, not those
sub-minis that will fail if you look at them crooked.

Jan, ICM, and Sentry... I must have spend hundreds of bucks when I was a young ham on FM crystals for the latest Motorola or RCA twoway castoff I was converting for one of the VHF or UHF ham bands! I remember when ICM had cheap EX grade crystals for experimenters, and when JAN would mail you list of cheap surplus crystals they had on hand.

Pete

I'm tryin to get this thing recapped and I got one of the set screws on the xtal switch all buggered up. It's made out of titanium or kryptonite cause I been after it with a drill for about 2 days and I barely dented it.

Two stops at Ace hardware on my way home for their best drills and I'm stymied. I started with a 1/16 white, then the black hardened, and now the cobalt. The cobalt is probaby the best, but they'res gotta be a better solution.

So what do kind of a bit am I looking for?

Next screw I think I'll try some WD and a little heat.

regards,
Bob

I'm looking for an IF Unit for a 390A receiver. That's the unit with
that has the Filters and BFO Controls on it.
Thanks, Chris

AFAIK all the screws in the SP-600 are plain steel. I've had
problems with RXs treated with anti-fungus material. Its
very hard to get off but long treatment with paint remover
will eventually do it. This stuff can get into screw holes
and glue the screws pretty effectively. Also, if the screw
is bare try Liquid Wrench. I've found it to be more
effective than WD-40 for unsticking things. Again, you may

have to use repeated treatments for a couple of weeks. Then
use an Easy-Out in a hand drill or some other holder you can
control.

Heathkit AM filters show up on eBay and at hamfests from time to time.

There are two types, big and little. They work in different radio's.

The big filters are from the first SB radios. SB-300 used the big filter, the SB-301 and SB-303 used the small filter.

Within the types, there are two bandwidths available. 3.5 kHz and 5.0 kHz.

The 3.5 was the optional filter for the SB ham band receivers like the SB-300, SB-301 and SB-303.

The 5.0 was the STANDARD filter for the SB SWL receiver like the SB-310 and the SB-313.

Expect to pay about $30 for a 3.5 and $100 for a 5.0 filter. The 3.5 is not "full frequency" and the 5.0 is more hi-fi.

You can force fit either filter type in any SB receiver but look for the proper size and it will bolt in.

good luck.

Bob,
If you're referring to set screws in the knobs, shaft-couplings, etc.,
they are, in fact, hardened steel. Drilling them out can be a futile
effort. A combination of penetrating solution and the proper size easy
out should do it. I will tell you , though, on occasion I have had to
use the Dremel tool with a cuttoff disk and dismember the offending
coupler, etc. as nothing worked. The worst case was a stuck main tuning
knob on a BC-348 that simply had to be removed. Now, that was a
job.........!

You want a reverse screw bit. It will drill a little bit, and in the
process it will loosen the setscrew. Try a local auto parts store for
a set of them.... most of the auto places only sell cheapies but they
will do the job once or twice.

> Next screw I think I'll try some WD and a little heat.

WD-40 is basically useless as a penetrating oil. Try PB Blaster or
Break-Free or something designed for the job.

Oh good.  Let's play 50 questions.  Answer: Hawaii.

Your turn--two questions:

1. What is the airspeed velocity of an unladen swallow?

2. What does Hawaii have to do with my question?

Scott gives good advice! I would definitely try the reverse screw
bits.

Pete

I have asked in a few places without success, so forgive me if you have seen this one before....

I am looking for a pin-out and voltage spec for a Monitor ovened crystal module. It has five pins on its base intended for PCB mounting, two at one end of the case are direct to case (ground), then three at the opposite end insulated.

The case is approx. 2" H, 1.5" W, .75" D - its foot print on the PCB being 1.5" x .75", with what I assume to be the frequency adjustment via a slotted screw via a hole in the base through the under side of the PCB.
Like this...

```
.     .  < 2x ground pins
   0     < slotted screw adjuster

.  .  .  < 3x insulated pins
```

On the case side is the following legend...
Monitor
7155-02
JF461871
10.000000 Mhz
84081756
54331

I am aware it is (and I'm looking for) a 10Mhz crystal. I suspect the three pins are - a 12v supply, 5v supply and and output.

It is a sealed unit, so I'm reluctant to attempt to open it up to glean any more information.

Ah, yes, an RF Ammeter is such a joy when struggling with wire antennas.
Especially if trying
to load with an inductor. (and a lot more efficient than a series light
bulb)
Old Chief Lynn, W7LTQ

They are typically 5v regulated with ground and output, some may have an input for a software adjust. Usually the pins are spaced for 14 pin DIP.

1 Electronic Control Voltage (if used)
7 Ground (case)
8 RF output (either sine or TTL)
14 Vcc (usually 5v)

There are usually extra ground pins. Replacements can be found, but are being obsoleted by various manufacurers. Rather than tearing it open, the surrounding circuitry will tell you what is what.

Typical:

What's wrong with the clunker you have? It may be repairable.

I will say that it's not too hard to make your own thermocouple ammeters
for HF, and it can be a lot of fun. I haven't tried to repair an existing
one, but it's really just two junctions and a meter.

Depending on the design of the carbon cell there is a tendency for the carbon to settle and "pack". Shaking or rapping the microphone will distribute the carbon so that the mic works again. Note that carbon mics are also position sensitive. Some may not work well if used in some position other than they were designed for. One of the design objectives for the Western Electric T-1 cell, used in the 500 series telephones, was to make them as much as possible independant of position and immune to packing.

Packing of a sort can also be produced by moisture causing teh granules sticking together due to moisture or because they have been fused by the application of to high a voltage.

There are other causes of poor performance, such as oxidation of the contact surfaces. Fixing that requires opening up the mic and cleaning the surfaces, which may be difficult where one of them is the diaphragm.

Carbon microphones were popular for communications equipment because they are amplifiers and, thus, can have very high output compared to a generator such as a dyanamic, magnetic, or crystal microphone.

What is "oyuo" "noting" "cognat" and "cancled"? It would be nice if
you could actually write something that came somewhere close to making
sense.

Hey, even cheap hams can afford dictionaries now.
They are available on the web at no charge.
Also many programs have a spell checker......

Debbie

Tnx dloydlav for changing the title back.
Why anyone wud want to change it is beyond me?
Why cannot they start thier own thread?

I have an HP-24 that is missing the top and bottom cover. I'd feel
better if I can box away all that. I've found that the cover is the
same as the HP-23 supply.

Before I call in my favor due from a machinist friend, does somebody
have a wreck/parted out supply that would be willing to part with the
covers?

Thanks!

David Goncalves

If you mean the HP-24 calculator, parts are available from International
Calculator in Florida.

Well no.  A calculator would never be classified as a radio boatanchor.

Plus  I don't think people working in plastic are called "machinists".
Clearly that's a reference to metal work, and if we're talking Hewlett
Packard pocket calculators, the casing was plastic.

No, surely he means the Heathkit power supply.  Was quite popular,
to power Heath equipment, but also I seem to recall people using
it to power other ham transceivers.

Last night, BBC 4 TV over here in the UK aired a compilation of Bob Dylan's
performances at the Newport Folk Festivals in the 60's. I was amused to
hear, in "Talkin' World War 3 Blues", the lines:-

"Well, I remember seein' some ad
So I turned on my Conelrad
But I didn't pay my Con Ed bill
So the radio didn't work so well!"

I often wondered what Conelrad was, thanks to this thread I finally know!

Using a shear and brake you could make both the top and bottom cover in about 15 minutes. As a matter of fact, a jig saw and a vice would be able to make one quickly. A good scrounger should have a few sheets of scrap perforated material around. You do not even need to weld the corners of the top - just a few short pieces of angle aluminum with pop rivets.

Save the debt owed by your machinest friend for something more difficult.

The original question was whether someone had a circuit diagram of a Conelrad device marketed by Motorola or Heath. I do not hink anyone answered the question, although there were wonderful distractions.

Specifically, the Heath catalog of 1959 (and other years) contains schematics of many of the Heath products, along with a description. I do have that catalog so I could scan the schematic. Although copyright protection has now been asserted as to Heath manuals, I do not believe it is being exercised as to those schematics.

I still have my Morrow Conelrad receiver in my shack. It still functions as intended and I often listen to the basketball or football game.

As to how an invasion works, I was down in Grenada the year following the US invasion and spoke with many of the "invadees". It turned out that the US did not have any good maps of Grenada, because they had not planned to invade that country. They entered St. Georges and went to the local travel agency and bought all of their maps of the island and used those to continue their invasion. The "bad guys" had occupied a school on the top of a hill right next to the ocean. The US gunships sat off shore and took potshots, with their big guns, at the school. I remember examining a Russian motorcycle that had been the victim of a direct hit. Not a lot of science involved. The inhabitants of St. Georges were treated to a good show. The local sandwich shop did well selling sandwiches to the US troops. The local radio station still had lots of bullet holes in it and I recall the radio station went off the air fairly quickly. Not sure if it was either 640 or 1240, though.

So, it seems that the best invasions, with the least loss of life, occurs when the country invaded is basically peaceful, with no arms and no ability to fight back. The entire process can be finished in a weekend. The inhabitants get a good show, make a profit selling supplies to the invaders, then get aid to rebuild after the invaders leave.

One of the persistant legends of the Grenada Invasion was that several times more medals were given out for that campaign than for people actually invading the island. I had a peripheral (and not terribly important) role in that invasion while in Washington all the time and I got a medal for it...and I was a DOD civilian!!!

One story I know to be true was that two joint commands, one was called COMFORCESCARIB and another one whose name I do not remember, one based in Puerto Rico the other based in Key West had Grenada within their area of responsibility. Both were headed by two star admirals. Neither command knew anything about the invasion and neither were involved in the planning or execution of it. They learned about it in the news. Grenada was in their Area of Responsibilites.

Some of us in Washington, not directly involved with the command structure, had problems figuring out which command was in charge of what. My office had a support function and we never knew who to support with what.

What they did get was two very pissed off admirals. Both admirals, realized in how high of esteem they were view in the Pentagon and both retired shortly thereafter. Since neither command played a roll in the invason, it was also realized that neither command had a real

function (one was known as a sort of dumping ground for old colonels
and captains awaiting retirement.) Both commands ceased to exist
shortly thereafter.

Hi Everyone,

I've decided to sell my National FRR-59A, the grandaddy of all National receivers. If you know your boatanchors, this is one of the best SSB receivers ever made. With it's 300hz filter, it's a killer on CW too. Mine is in good working condition and located in St. Louis, MO. I also have the manual for it which is about half the size of a phone book. Price is $1,200.00. I am planning on going to the Dayton Hamvention and can bring it with me if it is paid for ahead of time. Also, I travel to Michigan several times a year and can meet you anywhere between St. Louis and Detroit on one of those trips. Of course, local pickup in St. Louis is fine too. If you want it shipped, we'll have to talk as it weighs nearly 300lbs! If you want to see a photo, I have one posted on eham.net with an ad there.

I forgot to mention that the Navy and the Marines could not talk to each other during the Grenada invasion, even though they were within eyesight. They resorted to telephones. The local travel agent told me the Marines came in and made long distance telephone calls to the states. I assume things changed because of what they learned.

```

I wonder if anyone has a spec. sheet for this counter - my main concern is maximum input levels and the range of sensitivity covered by the variable input control. It would be interesting to know the spec for crystal oven also. (Not sure if the counter qualifies as a boat anchor but I guess it's all relative!)

73,

Charlie.

Yeah; doesn't 12 volts sound a bit high? While approx 100 ohms plus
1200 phms =3D 1300 ohms and therefore 12/13000 =3D about 9 mlliamps
current, just wondering if a combination of packing, moisture and
maybe a bit of carbon granule sparking at too high an energising
voltage could be contributing to the problem?
Energising voltage of around 3 volts was typical in many dry cell
telephones sets; or even on sets where 48 volts is/was fed out from
the telephone Central office .

Have seen a couple of 3 ampere 'Antenna current' TC meters fairly
recently on eBay. UK source I think.

Now, does the expansion of the knob make the hole larger
or smaller? My instinct is that all dimensions get larger,
hence the screw should be looser. Or maybe the answer is
some dry ice or liquid nitrogen. (That's only half kidding).

Tony, I wrote up a mod I came up with for Electric Radio, last year.
I'll send you the diagram for it if you'd like. Essentially, it moves
the filament 24v from the output side of the power contactor (inside the
dynamotor relay box, on top) and moves it to the input side. That way,
the filaments light up and gets things warmed up whenever power is
applied. When you want to xmit, just hit the power switch. When you're
done turn the switch off. My next trick will be to route PTT to an
external relay which will both key the transmitter and turn on the
dynamotor (paralleling the front panel power switch). When PTT is
released, the dynamotor stops. That way, no duty cycle problems arise.
Note also that in the manual, it says that the duty cycle of the
dynamotor is about 30 minutes, and that is at altitude. At room temp, I
figure one has about 15 minutes before things bad happen. The book also
says for ground maintenance activity, remove the dynamotor end bells for

cooling. Unlike the ART-13 and similar heavy-duty dynamotors, there is
no throughput cooling blower on the PE-73 or BD-77.

Regards   Jeep/K3HVG

I think that since the metal shrinks when colder, an inside diameter will
get larger and an outside diameter will get smaller too. It's all
shrinking, not collapsing on itself.

Wow, sounds like trying to do an old tube type TV IF alignment.
One can't just start tweaking each trimmer for maximum smoke,
of course. You've got to decide just which skirt of the filter's bandpass
shape each trimmer is supposed to be working on. If the manufacturer
doesn't tell exactly where each trimmer is supposed to be working,
it might be well to make a little chart of where you think each trimmer
should be working, and keep good notes of where you are going.
If someone hasn't already "aligned" it by "ear", you can usually
detect where each trimmer is working by twiddling it just a very little,
back and forth, while carefully watching the shape on the scope.
They normally will not drift off so far by themselves that you can't see
and watch just what you are doing, and where each trimmer was working.
Just keep cool, and don't make any giant moves until you can see
where you are going with each step along the way.
Also, keep in mind that the manufacturer's filter bandpass specs
were often pretty optimistic!
Old Chief Lynn, W7LTQ

Typically, Low IF shouldn't be aligned unless someone tweaked it or you had
to fix something. First sweep the Crystal filters and find the center of
those before going on to the tunable filter. These are not always perfect

or centered and you may find want to adjust the LO or tunable filters
slightly off to compensate. I like the idea of rocking an adjustment to see
what happens, as this can reveal where the problem is without upsetting the
whole alignment.

```

This receiver has a tube based PLL for the LO. This was completely off
on all bands due to the fact that all the cores of the Ls loosened,
they were kept firm with some sort of glue across the thread that
pulverized over the years. The vibrations of the drum did the rest.
After the alignment, it is now rock stable, better than the 8640!
However, I did not consider the IF filters when I did this, I tuned
the LO for *exactly* 3.3MHz IF that then become 300kHz after another
mixing with a fixed 3MHz quartz oscillator. It is not a good idea to
tweak this oscillator too, as it also generates the harmonics used by
the PLL. This is actually 3 to 5 Hertz off.

I am *very* worried of upsetting the filters. I like the idea of identifying which trimmer changes which part of the curve before attempting the real job and preparing a reference chart. I am convinced that some previous owner tried the alignment before and not necessarily did a terrible job. The manual just has charts with the expected shapes of all six, the number of peaks, at which freq they should be, the maximum ripple. The representation on the scope is linear, I suspect it will not be accurate enough. Today I tried with the digital scope, set the persistence to 10sec so that I can see a curve produced by ten sweeps, this seems to be an improvement. Also, -3dB=0.707x linear, the digital scope has cursors that also help.

Another thing I wanted to ask and you already mentioned: which filter to start with? The narrowest, this one is easier to center at exactly the right freq. You make a difference between "crystal" and "tunable", however this thing must be quite odd, the crystal filter is also tunable, has its own ten trimmers as the non-crystal types.

Thank you again for your help
Best regards
Paolo

FS: Henry 2KD-2 linear 2KW HF amplifier in excellent condition. This amplifier uses a pair of 3-400A tubes. The 2KD-2 amp is a desktop amp (matches the Collins S-line styling) with a heavy duty power supply that

site under the desk or console. This particular matching supply has been modified with a new Peter Dahl HV transformer. Includes the manual. Buyer pays shipping handling. No pix yet but will get some for serious buyers.
$685.00

I have a Collins KWM-2A (round emblem) that I've had several years. I've been using it on the vintage equipment net checkin on 75 meters, though I"ve used it on 40 meters some as well. It hasn't been turned on in about 18 months. The knobs all look good, the front panel has some blemishes around the white lettering on the exciter and PA tuning (the letters/numbers are okay). Lifting the cover shows it needs cleaning up (dirt and some corrosion) but all the tubes have been checked and are very good. Last time I used it it tuned up to over 100 watts out on 75M. The power supply that I used is borrowed so this sale doesn't include the supply. A complete manual goes with it but no mike is included at this price of $650. Buyer pays shipping/handling from 77840. I'll try to get some pix in the next couple of days. ....Mike, (979) 6964400.

One of the biggest issues of a radio with variable selectivity and passband tuning is figuring what is being tuned and how the IF and BFO might be shifting and what oscillators are being shifted in and out for various modes, then determine what filters are the least adjustable and see what shape you can get from them. Typically the monolithic filters, be they crystal, mechanical or ceramic can only be adjusted for input and output matching.

PLL cores are adjusted so that the VCO can be reliably tuned across it's range. The steering voltage is usually specified either at some frequency or at the extremes.

Offset oscillators for various modes also need to be accounted for.

Transceivers are even more critical because you will wind up poor fidelity and/or spurious. Loading changes can make a shift between transmit and receive too. I can't figure out how the High Fidelity SSB guys deal with phase noise and carrier rejections as they approach response below 200 Hz. Especially the ones who do a base boost to try to get fidelity out of the cheap 500-4000 Hz speakers in mobiles, but sound like a craphouse studio on a good quality station speaker.

3-5 Hz is pretty good but it just makes it more noticeable when the hum on the incoming signal is out of phase with the hum modulation in the receiver ;)

```

> Tony, I wrote up a mod I came up with for Electric Radio, last year. I'll send you the diagram for it if you'd like. Essentially, it moves the filament 24v from the output side of the power contactor (inside the dynamotor relay box, on top) and moves it to the input side. That way, the filaments light up and gets things warmed up whenever power is applied. When you want to xmit, just hit the power switch. When you're done turn the switch off. My next trick will be to route PTT to an external relay which will both key the transmitter and turn on the dynamotor (paralleling the front panel power switch).   When PTT is released, the dynamotor stops. That way, no duty cycle problems arise. Note also that in the manual, it says that the duty cycle of the dynamotor is about 30 minutes, and that is at altitude. At room temp, I figure one has about 15 minutes before things bad happen. The book also says for ground maintenance activity, remove the dynamotor end bells for cooling. Unlike the ART-13 and similar heavy-duty dynamotors, there is no throughput cooling blower on the PE-73 or BD-77.

Thanks Jeep,

I have already separated the 12VDC filament supply from the dynamotor 12VDC supply.

However I cannot use the dynamotor in the "PTT mode" because my dynamotor power supply is unable to start the dynamotor quickly. Though being a 100A stabilized power supply, its overcurrent protection trips until the dynamotor has not reached a certain speed. So, I must run a start-up procedure which takes time and is incompatible with operating the dynamotor in PTT mode. Perhaps putting a big car battery in parallel to the supply would solve the problem.

In any case I prefer not to use that noisy dynamotor and I am therefore currently building an AC supply.

73

Dunno if this'd work but, Locktite "High Strength Thread Locker" is pretty strong stuff. It's strong enough to lock the �" diameter engine cylinder head studs in my racecar's engine. Perhaps you could "glue" the Allen wrench into the setscrew (being careful to not get any on the threads), let it cure overnight, and try breaking the screw loose afterward. See http://tinyurl.com/9zvre5 to see which one might be "bestest". Poor quality (soft alloy steel) Allen wrenches will twist/bend... start with a good quality Allen Wrench. Use heat to release the thread locker. If *that* won't do it, I think you'll be drilling the screw out and retapping to the next larger size.

I succeeded in restoring my S-20R to its original circuit, as far as I can tell anyway. Now, is there anyone in this group who has an unmodified S-20R that they are sure is working right that can answer a couple of questions because I am not sure mine is.
1, Audio volume control leak, i.e., is there still audio when its turned all the way down?
2, How much distortion is there? Mine has too much and it gets much worse when the RF gain is turned down.

Both may be due to the configuration of the detector and AVC circuits but its hard to imagine a radio would stay on the market very long which was as bad as this.

Its evident that the circuits in the S-40 got revised soon after it was announced. Since the two circuits are nearly identical I am about to modify the S-20R to the revised S-40 circuit, which has a separate diode for AVC (eliminates the gas gate half of the 6H6) and uses "contact" bias for the 6SQ7 audio grid.

I've checked my wiring and can't find any errors but,
since the thing was heavily modified when I got it, I have
no idea of the original wiring layout and none seems ever to
have been printed.

Did you recap it? S-20R schematics are 'findable' on the web if you
want to revert to the original 'working' version.

Its been recapped. I have an original insruction book, actually, it the same one as on BAMA but much clearer, plus another, a Sam's from another site. I also have the schematics for all three versions of the S-40. I think the configuration I have now _is_ the original but it has too many problems. I wanted to know if this is normal for this model or not. Its hard to believe its normal. There appears to be something amis in the detector/AVC but tracing the wiring has not shown up anything _yet_. I just don't want to chase my tail if these were just not very good RX to begin with.

This could also be a wiring error due to the previous work done. I think I found all of them but maybe not. One problem is not having a wiring layout. I mean a physical layout, not just the schematic. They must have existed at one time but may have all been lost in the sixty-somthing years since the last S-20R was made.

Can you advise what "WTD" stands for?

Thanks,

Jim

  This message is in MIME format.  The first part should be readable text,
  while the remaining parts are likely unreadable without MIME-aware tools.

--0-294947417-1232399407=:19419
Content-Type: TEXT/PLAIN; charset=ISO-8859-1; format=flowed
Content-Transfer-Encoding: QUOTED-PRINTABLE

WTD seems to be a rare letter combination. Most of what I've seen is WTB,=
=20
which stands for Wanted To Buy. I had to read the text and infer that the=
=20
author was interested in finding a seller. The prospective buyer could=20
have indicated a few other things such as his location and how much he was=
=20
willing to pay and whether his email address was live (so many people have=
=20
munged email addresses or, worse, spam blocking software [people have, for=
=20
example, given me their email address but never adjusted their spam=20
blocking software so my email to them dissappears or gets bounced back to=
=20
me, thus making it impossible for any followup, fallback communication]).

He used the word "functional," also, and there is a range of functionality=
=20
possible in such gear. Doe the author intend to use it on the air? Or, if=
=20
you turn on the power switch, tubes light up and rig puts out half power=20
and "dirty audio" or what.

I wish the guy luck, but stuff like Collins usually ends up on eBay.

The author might well consider using google and search terms to see if=20
what he wants might be available someplace else.

I wish the guy luck, but stuff like Collins usually ends up on eBay.

The author might well consider using google and search terms to see if what he wants might be available someplace else.

Not sure if this was cross-posted, but in rec.radio.amateur.boatanchors, just four posts down from the original thread, is a post for a KWM-2A for sale.

Don't know what happened, but the ">" symbols didn't show up in my reply.
My response consisted of only the last paragraph above (starting with "Not sure").

Thanks for prompt service, Tom!
     I got the recap kits for the Hallicrafters
S-38 and the Knight T-60 today. The parts
look good, and it's going to be great working
with parts with nice shiny new wire leads instead of the
grey (almost unsolderable) wire on my crusty
junk box parts!

     Confess I've never done "restuffing" to get boatanchors
going for fun, but did a bit of it when working for food.
Older marine electronics gear often had "unobtanium"
parts.......  relays, vibrators and such where one could use
the original cases for newer guts, and it was really the
only way lots of old stuff could be repaired without
"reinventing the wheel".
     12 volt 60hz, 4 pin vibrators were my specialty.
(aided by a glut of 32 volt NOS vibrators) GRIN!
73, Old Chief Lynn, W7LTQ (and marine radar tech)

Okay, Old Chief.  Those 12 volt *60Hz*  vibrators were a scarce thing
back then.   Still are.

Hi Gang:

I  am  downsizing  my  collection  and thus have this very nice set of
radio  books  from  a  correspondence  course  from the 1930s that are
```

surplus to my needs. So I am offering them up for sale.

The following 4 titles were published by the International Textbook Company of Scranton PA for the International Correspondence School, ICS.

1. MEASUREMENTS, REGULATION, BATTERIES, 1928
2. ALTERNATING CURRENTS, 1935
3. DC CALCULATIONS, 1938
4. ELECTRICITY AND MAGNETISM. GENERATORS, 1928

All books are in very good condition. I am asking $20.00 for the set plus shipping or $5.00 per title. I will give priority to anyone wanting the set.

If interested please reply by e-mail.

Thanks and 73,

Michael, W1RC

Dear Sir:
I would like to see pictures of the set if possible. Thanks, 73.

Hi Gang:

This is a brand new CRT for a small scope. It is new in the box with
original packing and documentation.
I don't need it as I don't have the scope. $50.00 plus shipping.

If interested please reply by e-mail.

Thanks and 73,

Michael, W1RC

Great radio and I want one to go with my HT-37 transmitter but the
seller has a bad reputation. I have a SX111 but I tend to use the old
Racal RA17 with it as the performance of the SX111 is not good on 40m at
night. $1000 may sound like silly money but the SX115 was the best
available at the time and not cheap, you could buy a nice car for the money.

Point is he is flipping the radio for a very tidy profit.
Probably came off eBay a month or two back...
This shows why sellers should do good write ups
and take good photos; otherwise a middleman will
end up taking the profits.

Pete

>Stuff Barry Said...

My brief message didn't seem to hamper people from responding to my post.

If I post the most I'm willing to spend, how do I bargain that down later?
The radio is light enough to ship and not extremely fragile and most posters are located in the United States, so location is not very important. I'd be wasting my time if I my email didn't work - if I had problems, I'd have said something.

I think I picked up WTD from somewhere else and dropped it here. I will be careful next time.

> He used the word "functional," also, and there is a range of functionality possible in such gear. Doe the author intend to use it on the air? Or, if you turn on the power switch, tubes light up and rig puts out half power and "dirty audio" or what.

Jeez, do I have to write a full specification of what I'm looking for? Not wanting to waste time, I made the simple statement. Good enough for eliminating 'shoots sparks' and 'the knob doesn't turn' radios. Anything else, I'd like to talk over with the owner privately. Somebody who can't figure that it means, I'm not likely to get very good information from anyway.

> I wish the guy luck, but stuff like Collins usually ends up on eBay.

Yes, they are on eBay, but they are always at a premium. It takes little time to post on Usenet for, for what might turn out to be a very good deal.

> The author might well consider using google and search terms to see if what he wants might be available someplace else.

Done, done, done. I'm posting all over the internet in appropriate places, and calling many of my friends, looking for the best deal.

> Not sure if this was cross-posted, but in rec.radio.amateur.boatanchors, just four posts down from the original thread, is a post for a KWM-2A for sale.

Yep, contacted that guy too. His radio is nice.

The SX-115 is a real nice collection piece.

With regard to price, do not forget that e-bay is a world-wide bidding place. With some 7 billions persons on the earth, it should not be so difficult to find one or two willing to pay $1,000 for an SX-115.

Prices on e-bay generally tend to go up also because there are plenty of ingenuous people who cannot refrain from placing bids days before the deadline, instead of doing that by the last ten seconds, so raising prices for no reason.

73

This nice classic mic is in very clean condition. Is wired ti a
four-pin mic plug that works with early YAESU radios like the FT-101
series and others. Can of course be easily rewired for any radio.

I am asking $50.00 plus postage.

If interested please reply by e-mail.

Thanks and 73,

Michael, W1RC

Hi!

I recently found a new toolbar called HamInfoBar which is a Ham Radio
and SWL toolbar.

Check it out at:
http://www.haminfobar.co.uk/

I use it everyday and is an excellent addition to your Explorer or
Firefox browser.

Try it - you will like it...! :)

Thanks Scott,

The IF transformers was the easy bit, to be scavenged from a piece of
unused tube-type mobile radio gear that got overtaken by technology.
I've looked at the RCA Receiving Tube Handbook (RC35 in my case) but
would prefer a circuit that used more generally available (in
Australia) tubes. There *must* be some commercial FM broadcast
receivers that used a 6BA7 or a triode-pentode converter stage -
Zenith used a 12AT7 twin triode that works well.

All circuit source suggestions appreciated.

John

It's just simple math once you have the co-ordinates and elevations.
Not counting wind drift and thrust variations. You all have my prayers.
Pray for us too. We are besieged by idiots who don't seem to connect
what they want to any sense of reality. History has no meaning for them.

Thanks Scott,

The IF transformers was the easy bit, to be scavenged from a
piece of
unused tube-type mobile radio gear that got overtaken by
technology.
I've looked at the RCA Receiving Tube Handbook (RC35 in my
case) but
would prefer a circuit that used more generally available
(in
Australia) tubes. There *must* be some commercial FM
broadcast
receivers that used a 6BA7 or a triode-pentode converter
stage -
Zenith used a 12AT7 twin triode that works well.

All circuit source suggestions appreciated.

John

There are lots of schematics of consumer radios at:
http://techpreservation.dyndns.org/schematics/

You will have to explore around if you don't have specific
model numbers.
For design data there are several good books at Pete
Milette's DIY audio site at:
http://www.pmillett.com/

The Radiotron Designer's Handbook, 4th edition, is sort
of a standard and covers the relative merits of several
mixer and converter circuits.

The 6BE6 seems to be more common in commercial
receivers than the 6BA7, both should be used with external
oscillators. There are better converters for the VHF range.

I am not sure how tubes were numbered in Oz land but,
if British types are more common you should check an
equivalent tube chart. Many US and British types were
interchangable even though they had different numbers.

Scott Dorsey's suggestion to look in the RCA tube manuals is a good one. Many receiver circuits are nearly generic and those in the RCA books are generally reliable, at least as starting points and as aids in understanding how they are constructed.

There are other editions of the RCA books on line, some are at the Pete Milett site above.

I would also not discount the American Radio Relay League _Radio Amateur's Hanbook_ and the various editions of the VHF handbooks. These will have a lot of practical information on layout and the pitfalls of working at VHF and with high IF frequencies.

Hi John:

The 6BA7 might be a poor choice. It will have the highest noise figure of all the tubes you mentioned. I have never seen the 6BA7 used above 50 MHz, and that was only with an rf amplifier.

On the other hand, a triode or pentode would be acceptable, though it would hot have good weak signal performance.

The easy approach for a circuit is to look at the K4XL/ BAMA website and steal the mixer - oscillator circuit from one of the many receiver schematics available. There are some crystal controlled converters and you can steal the electronics from them. Ignore the rf amplifier if you are not going to use one. Tecraft made good converters, as did Filter King. Ameco also made converters and National had a series to go with the NC-300.

After awhile, you can build stuff like converters without a schematic - you just start picking up parts and start soldering. The triode has a bit lower noise operating as a converter. Decades ago, there was a 6J6 converter known as a ZL converter. That was simple and worked well.

You could also look around for an old tubed vhf mobile rig that would be available for hauling away. Steal the converter out of one of those. I have one here in Western Oregon you can haul away.

Up to over $2,000 now!
WOW:-)
I had 3 & sold them years ago for $500 each or less:-(

I've had this unit for years, and could not find anything on it, even on
Google..
Its so rare its time for it to go..
Take a look..

I could use a good copy, I have the Geloso VFO
that's going into a homebrew transmitter--no dial
scale came with it.

Just be sure that the dial scale matches the VFO type. Each VFO type has a different scale, except the 4.101 and 4.102 which share the same scale.

It is a 4/104 according to the label on the chassis.
6CL6 and a 5763. I assume this would drive a pair
of 6146 finals, or a 5894 in parallel, directly?

Pete

The VFO 4/101 tubes are 6J5+6AU6+6V6. It is used in the G.210 transmitter where it drives a single 807. Dial is n. 1640

The VFO 4/102 tubes are 6J5+6AU6+6L6. It was used in no Geloso transmitter. It can drive two 807s in parallel. Dial is n. 1640 (same as VFO 4/101)

The VFO 4/103 is for VHF. Dial is n. 1647

The VFO 4/104 tubes are 6CL6 + 5763. It is used in the G.212 transmitter where it drives a single 807, and in the G.222 transmitter where it drives a single 6146. Dial is n. 1646

The VFO 4/105 (conversion type) tubes are 6U8+6AH6+6CL6. It is used in the G.223 transmitter where it drives a single 6146. Dial is n. 1657

I have a scan of dial n. 1640

I do not have a scan of dial n. 1646, but I could take it removing the dial from my G.222 transmitter (provided that it is not too complex)

I do not think that the Geloso dials are on the web, but of course you may try.

73

Tony, Please do not go through that amount of trouble on
my account, although I do appreciate the offer. I can make
a dial if I have too.

Peter

I will do it anyway, so as to enrich the web page where I have put the Geloso schematic diagrams.

If you go tomorow at bottom of page http://www.qsl.net/i0jx/geloso.html you will find the dial scales.

Price Reduction. BRAND NEW ALPHA 91B AMP FOR SALE. This ALPHA 91B is really brand new. I purchased it from the original owner a few months ago who never turned it on. Not even once. I put the AC power cable plug on it when I received it. Alpha sells these amps w/o the power plug. I took the 91B to my friend who is an Alpha technician. He brought it up slowly with a Variac and cooked the finals for 24 hours to get rid of any gas from setting so long. When we fired it up, it worked perfectly. I saw it put out 2500 watts PEP into a dummy load. It has sit in my shack ever since. I never hooked it up. Too many amps. If you have been wanting a new Alpha, here it is. I can varify its history. This amp covers from 160 to 10 meters. It has had the 10

```
meter mod. done. Digital pictures available. Price is $3295(was $3550)plus
shipping. Thanks, Charlie Hugg, K5MBX

I'm looking for a dead HP848x (e.g. HP8482A or similar) RF power
sensor head to rescue from the trash.  All I need is the connector
(the one to the cable to the readout box)--don't care about any of the
rest of it.  Anyone?

Cheers,
Tom

What is that connector?  As I recall, this stuff mostly used standard
military-style KPT connectors.  If you have a number on it, someone may
have a match.

I have a NOS T-17 carbon microphone that I use with my BC.-191.

The modulation level is rather low, but I cannot easily determine whether the problem is with the transmitter or with the microphone.

Two questions:

1) I have been told that carbon microphones can be revitalized by leaving them in an oven for an hour or so at a temperature of about 180 F. Did anyone try to do that? It would be easier to put the entire microphone in the oven rather than just the capsule, but I am not sure on whether this could cause damages to the non-metallic parts

2) I would like to test the microphone by measuring the output voltage with an oscilloscope while talking. Does anyone have an idea on how much (peak) voltage I should see on the scope when powering the microphone with 12 V, through a resistor of known value?

Thanks & 73

Tony I0JX

I've never heard that, but back when telepehones uses carbon mikes, it was
popular to fix them by removing the cartridge inside, and banging the
cartridge on a table top.

Geoff.

Hello:
I am planning to sell or swap for an ALPHA 91B| or similar for my very

rare SSB package.

You will find the first SSB 1922 articles by Carson who got the SSB patent in 1923.
The very rare 1956.special SSB issue of the PROCEEDINGS OF RADIO ENGINEERS.
The 1954 book SINGLE SIDEBAND PRINCIPLES AND CIRCUITS by PAPPENFUSS et al at COLLINS.
The 1995 SINGLE SIDEBAND SYSTEM =A7 CIRCUITS also written by COLLINS engineers including digital methods.
Plus my very clean and working COLLINS KWM 1 including power supply and DX adapter.
This is the very first 1957 ham SSB transceiver model that made ham history as the very first SSB transceiver used in a DX-expedition and remember the very angry Chrustjew hitting the table with his shoe in the UN? Because of the American spy plane shot down by the Russians.
It had a KWM-1 aboard! Less than 1500 made and rare.According to a recent QST article.

It was Nikita Khrushchev who was not a Jew, although that may just been an unfortnate spelling error.

http://en.wikipedia.org/wiki/Nikita_Khrushchev

According to the wikipedia article, the shoe banging incident had nothing to do with the U2.

http://en.wikipedia.org/wiki/Shoe-banging_incident

It occured on 12 October 1960.

According to

http://en.wikipedia.org/wiki/Gary_Powers

The U2 incident occured on May 1 of that year, so it is possible that it had some influnce on the proceedings, although it was not mentioned.

The KWM-1 was introduced in 1957, so it is possible that one was aboard that particular U2 when it was shot down. I have not been able to find any production figures, but they may exist. At $820, it would not be a popular rig. The average annual salary in 1957 was $5500 in the U.S., so a KWM would be 2-3 months take home pay after taxes.

If you are trying to sell it, I suggest you contact the Collins Collector's Society, their members would be the most likely to be interested in it an pay you the best price.

Geoff.

Additionally, that procedure is a legitimate and it is intended to break up and separate the clumped up carbon particles.   A frequent procedure for outside pay phones back in the old days. You would smack the mic on the metal plate under the phone.

Oh, gosh! I didn't know the cartridge was supposed to be removed before
banging. I thought that the fix was to just whack a carbon microphone
on the nearest indestructible object. The mikes that came with the BC-191
and/or BC-375 often had metal housings and could be used as hammers
in an emergency.

I have done this before, although not to a T-17. The idea here is to bake all the moisture out of it, because the moisture causes the carbon granules to cake up and stick together. It took me a lot longer than an hour or so.

180'F isn't really very hot.

> 2) I would like to test the microphone by measuring the output voltage with an oscilloscope while talking. Does anyone have an idea on how much (peak) voltage I should see on the scope when powering the microphone with 12 V, through a resistor of known value?

I do not. BUT, I would suggest first of all measuring the static resistance of the microphone and comparing that with the resistance of a known-good microphone.

I might also try using a telephone transmitter element (in the US we have lots of Western Electric T-1 transmitters everywhere) and comparing that with the test microphone in measured sensitivity.

The static resistance is about 100 ohm, but I do not have another carbon
microphone for comparison

> I might also try using a telephone transmitter element (in the US we have
> lots of Western Electric T-1 transmitters everywhere) and comparing that
> with the test microphone in measured sensitivity.
> --scott

I tried to power the microphone with 12 V through a 1200 ohm resistor. Talking
loud into the microphone and with the mouth very close to it, the scope (put
across the microphone leads) shows a peak voltage of about 600mV (or 1200mV

p-to-p). Perhaps it is good enough, but I am not sure on whether the bias current is too low, and I should then try again using a lower resistance.

Carbon microphones are not generators, they need an external source of power. Typical voltage is around a volt or two, the less the better. The simplest way to test the mic is first to measure its resistance and see how much that varies when the mic is shaken or tapped. It will change some even on properly working mics. In the absense of a proper transformer check the audio quality using a battery and series resistance. Pick up the audio across the resistor.

Carbon mics are prone to "packing" which is when the carbon granules stick together. Sometimes this is caused by moisture, sometimes by being subjected to too high a voltage which causes the granules to fuse. To get rid of moisture the element must be baked. If it is possible to remove the carbon granules and bake them separately that is best because a much higher temperature can be used. It might also work to put the element in a sealed box with a moisture absorber in it for an extended period.

Nearly all carbon mics need to be stirred up pretty frequently. About the only ones that seem immune from this are the elements used in late WE telephones. They are designed so that they are not position sensitive and are well sealed so they don't much pack. Other types are position sensitive and won't work in some positions, for instance facing up or down. Its normal for most of these mics to need shaking pretty frequently.

Carbon mics were very popular for many uses because they are amplifiers. This results in very high output. The vices are high noise and high distortion, at least in single-button types.

The highest voltage that should be applied to a carbon mic is probably around six volts, but the lower the voltage that will result in adequate output the better since higher voltages tend to cause arcing and fusing.

I have a set of brown bakelite knobs used on Johnson radios:

6 small fluted with white pointer dot
2 small knobs with 100 - 0 on brushed metal skirt
1 large fluted with white pointer dot.

Each may be had for $1.00 bubble-envelope SASE, $8.00 for the whole
set.

PLEASE include your name in the subject when sending an email
response.

R-390 Stuff, Non-Crazy Prices.

1 - Coupler Disc $1.00
1 - large tube shield/cooler, ES1123-2 / T12-1030
1 - Chassis Mount 10uF 300VDC $2.00
2 - Veeder Root Counters $3.00
1 - Counter Bezel, sans glass $0.50
1 - Pair of Handles - $5.00
1 - Antenna Input Module $3.00
1 - RF Section Top Cover - $5.00

RF Section Transformers: I have all but one of the Z201/Z207/Z213
transformers. $1.00 each. $25 for set.

Shipping extra, payment with SASE padded envelope please!

Microphones vary but 100 Ohms is about right. Take the audio from the series resistor rather than the microphone. Set the voltage so that the drop across the mic terminals is about one to two volts. You can run more but the least is the best. Most devices, transmitters, etc., using carbon mics use an imput transformer with a primary of somewhere around 100 ohms and a secondary suitable for what you are feeding, usually a high impedance. The exciting voltage for the mic goes through the primary usually with a capacitor across the battery to insure a low impedance audio frequency path and minimum noise.

See what you get and post again.

Thanks for the idea, Scott, but no, they have no spline keying. The
locking ring is threaded, with male threads on the plug on the cable.
I suppose I can get a part number, but suspect if I can even find
someplace that will sell me just one, it will be considerably more

than the cost of shipping a dead unit that someone was going to toss anyway.

Cheers,
Tom

Well, I'm not familiar with A&N connectors, but I gather A&N deals
pretty exclusively in high vacuum stuff.  These connectors aren't
sealed.  I'll see if I can come up with a manufacturer and part number
tomorrow.
```

Doesn't everyone with a basement have a box or two in it? ;-)

Cheers,
Tom

Tony, I just looked at a couple of single-button mics. The best one is an old military T-32 that used an early. large telephone-type element. Using a Simpson 260-8 VOM, I get a 400-500 ohm upward swing, with a whistle into the mic. Several "known good" T-17s get 200-400 ohm swings, less that the T-32. I find that I can get a very good idea of what's up by this simple test. I find also that its not so much the absolute static resistance but the amount of "swing" and hence, activity of the element. Of course, an element with several Kohms worth of static resistance would probably indicate a suspect element.

Regarding T-17s, I've never been able to truly resurrect an element. I have found that the bypass capacitor, inside, can be leaky or shorted and can cause the problems. That, and some pretty corroded plugs and PTT switches. If you have a T-17D, they can't practically be fixed and require a new element be fitted. If you disassemble one of those, the carbon granules will spill out owing to the construction of that particular model. The straight T-17, the A, B, and C models can be more easily retrofitted. The H-33/PT handset element or one from one of those 1950's style telephone receptionist boom-mic/headsets work very well.

Maybe we need to discuss what you really want to accomplish.

My experience with T-17 microphones 50 years ago is that they are just not very sensitive. I assumed this is deliberate - to make yourself heard over the noise in an airplane you have to yell into the mike.

Now if you want to preserve an authentic T-17 then I guess something like baking the transmitter is about your only hope, and you can only hope to make the mike as good as it was when originally manufactured.

I remember lots of guys in the old days, who were not interested in historic preservation, simply took the carbon element out of the T-17 and attached the wires to a Western Electric F-1 element and taped it in place. F-1 was the element used in the 302 telephones, forerunner of the later T-1 used in the 500 type sets.

If you want to preserve the appearance of the T-17 but not the authenticity, then maybe you could get the original element out and replace it with either a T-1 or an electret mike behind the faceplate and nobody will know the difference (except you will sound a lot better on the radio).

I was working with some military handsets a while back that use the equivalent of a T-1, and replaced the old transmitters with new T-1s. I also got an electret T-1 replacement from Mike Sandman - it was designed for use with a modular-corded handset, but with a little hacking I got it to fit into the older kind of handset.

Has anyone worked out the circuit to use an electret like you get from Radio Shack - they have 2 and 3 terminal models - to replace a carbon element?

Jim, I'm surprised you didn't need an amplifier with that electret
element? That's what the carbon-compatible mics use in 2-way and
avionic installations to get the required output level and the correct
low-Z. Also, the larger telephone elements won't fit inside the T-17
housing and would have to be mounted, up front, as you mentioned. I did
a military mic article for the June 2007 issue of Electric Radio, if
anyone's interested. DE K3HVG

Since T-1 elements are fairly plentiful one can get the carbon granules out of one to repack the T-17. I did this a long time ago to repack a Western Electric 375 double-button broadcast mic. It worked fine but was, of course, tedious.

Where the original carbon granules have been fused due to excessive current (too much voltage) simply drying them out will not fix them, they must be replaced. I don't remember how the T-17 element is constructed but most carbon mics are made so that replacing the carbon can be done.

Since I undertook restoring an S-20R recently I researched this receiver and its relatives. What I found is interesting: the same basic receiver was built in various guises from 1939 to 1968!

The S-20R is sufficiently different from the S-20 and earlier "Sky Champion" models to consider it a new model. It was built from some time in 1939 until 1945. It was replaced by the S-40. In the S-40 the RF and converter stages are changed to more modern tubes to improve performance at the highest frequencies and there were a few other changes (like ferrite core IF transformers). There are at least three versions of the S-40. The earliest ones were essentially identical to the S-20R with exception of the afore mentioned tube type change. After early production the loudspeaker was changed from a field coil type to a permanent magnet type. There was also a revision of the first audio stage to change bias to "contact" bias instead of cathode bias, probably to reduce distortion. The S-40A had some additional slight revisions.

The S-40B was changed mostly, I think, to lower production costs. The front panel was simplified and one tube was eliminated. In the earlier receivers the half of the 6H6 acts as a "gas gate" diode to prevent the AVC line from becoming positive if a tube gets gassy. This was eliminated. Half the 6H6 now became the detector/AVC and the other half continued to be the noise limiter. The 6SQ7 was replaced with a dual triode half of which is the first audio and the other half is the BFO, the 6J5 BFO tube being eliminated. Also, the RF transformers were changed so that on the two lower bands the RF stage is series fed from the antenna. That was undoubtedly a cost saving step plus there should have been enough gain and selectivity for the broadcast band and lower HF band with out the transformer coupling.

The S-40B was replaced with the S-85, which is identical electrically. This receiver has two large dials symmetrically placed on the front panel requiring the speaker to be relocated to the lid. The S-85 was replaced in turn by the S-108. Again, the changes are mostly cosmetic. This RX has a large slide-rule dial for the bandspread and, again, the speaker is in the top, but the circuit is identical to the S-40B. The S-108, and also I think the S-85, have a separate band spread capacitor rather than the second set of plates on the main capacitor. This was probably done because both of these receivers have calibrated band spread instead of just a logging dial as in the earlier versions. Otherwise there is very little change.

While the various versions of these receivers can look quite different a careful examination will find that the layout and placement of the controls did not change from the S-20R to the S-108. Thus we have a family of receivers that lasted for some twenty-nine years, a pretty good record for any design.

Looking to buy a good RF ammeter...but only a good one. I've already got a clunker I bought off of eBay and
don't need a second. Prefer something from 0 - 2 amperes or so. Crummy lookin' is ok so long as it works.

Where does the S-77a figure in your timeline? I have one, and it appears to
be identical to an S-40.

When I used to use them, we always repaired them by several sharp bangs
against against anything sturdy enough not to be damaged by the "hammer".

The S-77 is an AC/DC version of the S-40B. It dates from the same period, about 1952. At one time DC current was supplied in many areas of the US and other countries as well as aboard ship so receivers capable of running on it were made. There is also a cost saving where the power transformer can be eliminated but I this this does not apply to the S-77. Hallicrafters built several AC/DC models of AC only radios. Radios operating on DC must have series string heaters that add up to 117 volts or must have a series resistor where the filament sring is not sufficient. Also, the current demand of all tubes must be the same. Some receivers, and I think the S-77 was among them also had a balast tube to help drop the voltage and also stabilize it.

It was pointed out to me that the SX-25 was essentially an S-20R with the addition of a crystal filter, S-meter, and push-pull audio output stage. The later SX-99 and SX-110 are essentially the S-40B with the crystal filter and S-meter added but maintaining the single-ended output stage. Hallicrafters sure got a lot of service out of that design:-)

If you go over to Yahoo! and check the Yahoo Groups for
the Heathkit forum, you will probably someone there who
can help. If you have a model number for the Heathkit it
would helpful too. There is a German site that still has
the Heath schematics available for download.

to monitor AGC voltage on the monitor receiver. When

The Heathkit was a model CA-1. It used a 2D21 thyratron
the station went off the air, the thryatron fired and locked
a relay which had contacts for the whatever notification
device was being used. AGC sensitivity could be set from
a volt or so to about -20 volts. Looked a bit like the
QF-1 box.

I e-mailed you what I think you need, Fossil. Let me know if it didn't come through and we'll figure something else out.

There are service instructions and handbooks on a couple of web sites.

http://techpreservation.dyndns.org/schematics/

and

http://bama.sbc.edu/

I've found additional material elswhere but can't find the bookmarks.

Note that there were at least four versions of the S-40 and S-40A. Mostly the differences are minor but the detector-AVC-noise-limiter stages were changed a couple of times.

Hmmm. Well that didn't work. I've scanned, cut and pasted the S-40A parts list to my website for you, Fossil:
www.hayseedhamfest.com/4fossil.gif .

If you need more info, schematic, etc. or if the image didn't come through right, you can reach me by clicking "contact us" on the main page: www.hayseedhamfest.com .

If you're in need of a re-cap kit, please give me a shout.

73,
Tom N�JMY. .

I have for sale 2 RCA transmitters. These were working units when
pulled and were stored afterward
The radios are in good cosmetic condition. These would be great radios
to turn into a repeater. Will sell individually or together. Asking
$40 each. If shipping is required, buyer will pay exact shipping cost.

Thank you for looking.

Carl.

Wouldn't that depend on the price? If the price is low, you may
want to pick up a spare. If the price is high, you may want
to give thought to whether you really need yours or if you should
sell it.

I lived in this era. Back in the 1950's there was a program called CONtrol of ELectromagnetic RADiation. Subtitled CONELRAD. All AM radios (FM was in its commercial infancy, we only had Public Stations in the FM band) had little triangles with the Civil Defense logo at 640 Kcs and 1240 Kcs. [Kilocycles (per second) here is not accidental, Hertz, as a term to mean cycles per second, was not adopted until the mid-1960's.] In the event of an emergency, usually interpreted to be an attack upon us by the Russians (this WAS the McCarthy era after all) you were supposed to tune your AM radio to one of those two frequencies for information on what to do. Inplicit in that was that all other radiostations would get off the air so that they could not be used as homing devices for attacking aircraft. The fact that there were other methods to navigate was blithely ignored.

About 1957, CONELRAD was expanded to include amateur radio stations and all stations were obliged by the FCC to have a CONELRAD monitor which would tell you that an emergency was declared, that you were to get your own station off the air, and like the rest of the population tune to 640 or 1240 AM.

This ruling was more observed in the breach than the observance. And few amateur stations did anything about it. [My response...I was a teenager then...was to look for a mushroom cloud. If I saw one, I'd get off the air. :-)

A few companies built add-on CONELRAD monitors. If I remember correctly, you attached the device to an ordinary AM radio which was already and always tuned to 640 or 1240 Kcs. (1240Kcs. actually happened to be the frequency for the station in my own hometown in Wisconsin.) When some keying signal came on, the CONELRAD monitor would alarm and then you were to get off the air. It didn't retune any radio to anything, it just told an alert went off as broadcast on one of those two frequencies...at least that was all a ham version did. In theory, you could just have a small radio playing in the background which supposedly would tell you the same thing.

In actual tests, which were conducted from time to time, just as Emergency Service Tests are occasionally heard now. All of a regions stations got on one of those two frequencies (to confound the enemy's direction finders) and they had some sort of switching so that they all broadcast the same message from "Big Brother" but broadcast them in some sort of rotation. The few tests that I actually heard knocked our local station off the air, but the "emergency" broadcast itself was total gibberish because there were too few stations in our rural part of Wisconsin by day, and nighttime propagation was too screwy to provide any responsible path.

I don't remember when CONELRAD died as I went off to college in 1960 and wasn't on the air very much and not at all when I was in school.

It was dead when I got back on the air with any regularity after I had graduated..

Heathkit did indeed built such a monitoring kit. It was in the same size box as their famous QF-1 Q mulitiplier or their earliest SWR in-line monitor, one of the first with a Monimatch architecture. It cost somewhere between $10 and $20 as a kit IIRC, but that was too much allowance money for me to spend. Even as a teen, I had a keen sense for Governmental BS (which paid off well later as I was a career Federal Employee for 35 years in the intelligence world. You needed a steep skirted BS filter to work in that environment.)

CONELRAD was one of the biggest governmental flops ever in the communications arena.

Jon W3JT (K9CAH back then.)

CONELRAD was inspired by the supposed fact that the Japanese aircraft that attacked Pearl Harbor used a Honolulu broadcast station to home on the target. Conelrad required all broadcast stations to leave the air during an alert and certain stations switched to 640 or 1240 Khz, depending on which was closer to its normal frequency, and operated with low power. All ham stations were supposed to leave the air. The stations switched among a group to cause RDFs to become confused, at least that was the idea. All stations were fed with the same audio, which originated at the key station of the group via a telephone network. My memory is that all stations had monitors tuned to the key station which were tripped by a tone of some sort. In Los Angeles KFI was the key station with KMPC (710) acting as back-up when KFI was off the air. Because of its function as the key station KFI began broadcasting twenty-four hours a day except for a few hours on Sunday nights for maintenance, during which KMPC stayed on the air.

There was, I think, only one nationwide test, and a few local tests. It was quite possible to identify some of the individual stations by their sound and the key station could be identified by the higher audio quality. The system was a failure but contributed to the general panic about a possible Russian neucular attack. A lot of people were convinced that a Russian attack was inevitable and there was quite a scam going at the time among contractors who offered to build bomb shelters in your back yard. I wonder how many of those bomb shelters still exist.

I did a Google search after writing all this and found a couple of good sites:

http://en.wikipedia.org/wiki/CONELRAD

Jon;

An excellent summation of CONELRAD. The only correction is the lower frequency. It was 620 Kcs which is half the upper frequency of 1240. This was for reception at the higher freq by use of the harmonic effect.

When I was in high school in the late 50's we had a school fm broadcast station. Our CONELRAD detector was a standard receiver with an addon device that squawked when the carrier was lost. Our control station was Radio station WOWO in Fort Wayne IN. We tested the receiver every hour by pressing a phone jack in. This acted like the loss of carrier from WOWO and sounded a LOUD horn. When WOWO would loose it's carrier due to what ever it really got your heart going. We were in the middle of the great nuk war threat and never knew if or when the balloon would go up. HI HI..

CONELRAD operated by switching the active carrier of several radio stations around the country in a random sequence so that Soviet bombers could not use radio navigation to locate any specific target for bombing.

I agree that CONELRAD and the whole CD effort, for that matter, was a total flop. Great PR but a flop never the less. Growing up just south of Cleveland OH and the later near Grissom AFB (a SAC base about 60 miles north of Indianapolis IN I held no expectations of surviving any nuk attack.

Naw, Michael. If I'm buying, the price will be much, much lower than if I'm selling.

73,

Dave K8MN

I wonder if any one can help me scanning for me a DIAL of Geloso
transmitter.
The one I got is seriously disturbed by foreign paints.

I sent you the dial image and the Geloso Bulletin with the G.210TR description
to your private e-mail address.

>
> When I was in high school in the late 50's we had a school fm broadcast station. Our CONELRAD detector was a standard receiver with an addon device that squawked when the carrier was lost. Our control station was Radio station WOWO in Fort Wayne IN. We tested the receiver every hour by pressing a phone jack in. This acted like the loss of carrier from WOWO and sounded a LOUD horn. When WOWO would loose it's carrier due to what ever it really got your heart going. We were in the middle of the great nuk war threat and never knew if or when the balloon would go up. HI HI..
>
> CONELRAD operated by switching the active carrier of several radio stations around the country in a random sequence so that Soviet bombers could not use radio navigation to locate any specific target for bombing.
>
> I agree that CONELRAD and the whole CD effort, for that matter, was a total flop. Great PR but a flop never the less. Growing up just south of Cleveland OH and the later near Grissom AFB (a SAC base about 60 miles north of Indianapolis IN I held no expectations of surviving any nuk attack.
>
> Dave Nagel
> WD9BDZ

I'm afraid that 640khz _is_ the correct lower frequency. Somewhere, buried in some archive, the developmental documents for Conelrad may still exist and may explain the choice of frequencies. I think mostly it was to have a frequency that would be usable for any BC station. I also don't remember (if I ever knew) the power stations were supposed to use, I think quite low, perhaps a couple of hundred watts.

640 was VERY vacant in those days and 1240 was very full. I think the mindset was to cover both extremes but thats only a guess on my part.

When I was a kid I never quite figured how it was supposed to work. We had a local station on 1240 but it was not the Conelrad station. I later learned that it was one of the other stations who kept an auxiliary xmtr available on 1240 for that purpose.

I was only 10 y/o when the scheme ended in 1963 but I recall a neighbor ham explaining to me about the Conelrad 'monitor' in his shack.

Depends on where you were.

KFI in Los Angeles (actually La Mirada) has been on 640 since 1922 and
running 50 KW since 1931.

Thats what I mean about VERY vacant. Look and see what else was on 640
back in the 50s/60s compared to other frequencies.

Since at that time, it was a clear channel station, one wouldn't expect
any other stations.

How was it a failure? The reason it was dropped, IMHO, was that by November
of 1962, it became obvious that the Soviet Union was no longer dependent
upon bombers to attack the U.S.

Missiles had replaced bombers, and they don't need local radio stations
to navigate.

Geoff.

KFI was a Class 1-A clear channel, not duplicated at night and with few daytime only stations on the same frequency and those located in the East.

KFI was the key CONELRAD station in LA. It is one of the very few stations to operate on the same frequency as it started on. KFI's original studios and transmitter were in the Earl C. Anthony Packard dealership at 1000 S. Hope St. (10th and Hope) this had the original flat top antenna on top and I believe the original 5KW transmitter was maintained as an emergency transmitter until ECA's death.

La Mirada is a fairly recently established city. The transmitter location used to be given as "near" Buena Park. I it when it was in the sticks, mostly dairy and truck farms.

```

A few weeks ago I posted a yell for help about an S-20R I bought at a local swap meet. While working this unit had been modified and I wanted to get more information. This is to thank those who helped and encouraged me. I was able to get re-stringing information and restrung the band spread dial. One important tip came from Phil Nelson who recommended braided Dacron fishing line for dial cord. This stuff works like a charm, is easy to find (any shop that sells fishing equipment) and cheap. Doesn't stretch and is not slippery.

I researched the S-20R and its successor, the S-40/S40A/S-40B and picked up a lot of information about how they were designed and how the design evolved over time. For those interested I found that the S-20R had at least one revision and the S-40/A at least four. The S-40B is a re-design rather than a revision with many changes including styling which lead me to believe it was done mostly to lower the production cost in order to enable price competition.

I made one change in the S-20R and that was to change the bias method of the first audio stage from cathode bias to "contact" bias, as used in the S-40A. This reduced distortion considerably especially on weak signals.

The performance is quite good. Consider that this was an economy model and is at least sixty-five years old. Dial calibration is surprizingly accurate on the first three bands. I did some tweaking on the top band and improved it but its not as good as on the lower frequency bands. I think Hallicrafters was stretching things to get it up to 44 mhz. Its quite sensitive and the AVC will handle very strong local broadcast stations with the exception of a 50KW some three miles from here. That works on a short antenna. It also works pretty well on the ham bands and is more stable than one would think, quite capable of receiving SSB signals on 20 meters.

Since all the AM stations locally process the hell out of their audio I tested for audio quality using a Hewlett-Packard 606-A signal generator fed with a high quality source. This generator has a quite high-fidelety modulator in it. The audio quality of the RX is very good considering its a single ended pentode and a small speaker.

I was lucky that this RX was in good cosmetic condition so I didn't have to do much more than detail cleaning. It is a neat receiver. Its sitting across the room glowing at me right now.

I think I posted a tip about using tooth paste to clean plastic dial windows. Here it is again in case I didn't. Toothpaste with a cotton swab will remove cloudiness from many plastic materials including cellulose acetate and nitrate. It also works on scratched CDs.

Again, thank you to all those who helped with this project.

"George McLeod" <georgemcleod@optusnet.com.au> wrote in message
news:497c78ec$0$2708$afc38c87@news.optusnet.com.au...

> Would anyone have a circuit, or know where to find one, for the Conelrad
> device as marketed by Motorola and Heathkit.

Monumental failure? Easy conclusion, evidently. However there are still
WMD's pointed
at us, and we still have them pointed at others. Of course CONELRAD is not
an effective scheme any longer, but when WMD's traveled by airplane, and
came from
known geographical spots, CONELRAD was a pretty effective at denying
precision
target identification using simple navigation instruments.
I was always dismayed by having to have our radio or TV turned up so
loud that
it could be heard back in the hall closet that was my "shack". When Wife was
home, the
volume could be turned down, and she was to tell me if the station went off
the air.
(and it did, occasionally, sending a little chill, until determining that it
was not an alert,
but a "technical problem")

```

I'd like to build a simple tube-type FM broadcast tuner. So far it looks like a 6BA7 is the best bet for oscillator/mixer but I need a circuit to avoid the pitfalls and/or reinvention of the wheel.

Other possibilities are triode oscillator/mixers using 12AT7, and triode/pentode using 6BL8 or 6U8, even 6X9. 6HG8, which has very high transconductance and triode and pentode on a common cathode seems to have possibities too.

I'd appreciate it if you could share your favorite VHF/FM converter circuits with me.

Thanks,

John VK3XAO

Could I please say thank you to all of the people responding to my original
request.

Have succeeded in finding the actual circuits and manuals available via
E-Bay

The amount of information that has been given on this Newsgroup is simply
amazing - thanks again

That's part of why it was a failure. The US invested a huge amount of money
in defending against a bomber attack, and they continued investing that money
years after it became clear that missiles were a more pressing threat.

>Missiles had replaced bombers, and they don't need local radio stations
>to navigate.

Well, for that matter neither do bombers, if they are equipped with INS
systems much like the missiles would be. In fact, bombers were probably
more effective in an RF blackout, seeing as how they were navigated by
human beings with maps and pilotage as well as by electronic systems.

Look in the back of the RCA Receiving Tube Handbook. There are some
nice designs in there that are pretty bulletproof.

Your problem is going to be finding good IF transformers, more than
anything else.

That to me does not make any sense. In an arms race, you pay (or invest)
in something that protects you NOW in the hope that it works while you
invest in something that will protect you in the future.

I'm not fond of the whole concept of an arms race, but sometimes we have
one forced upon us.

They may not of had good maps, etc at the time. The Soviet Union was not
as well equipped as the USAF.

Geoff.

LOL.
I don't think it would take much of a map to find Los Angeles or New York City or any other major U.S. city. Conelrad was sort of locking the barn door not only after the horse was stolen but after horses weren't used any more.

Until about fifteen years ago you could still see where one of the large stages at Warner Brothers was marked "Lockheed Aircraft", a left over from WW-2. WB is a few miles from the old Lockheed plant and looks sort of like it. Conelrad belonged to the thinking of the same era.

Geoffrey;

You should know that there is no such thing as a temporary governmental
project. And that's what these amounted to.

Dave

Now we have Google Maps that can be used for pin point targeting by pesky
salesmen, paparazzi and any other nefarious character.  The threat is more
real now.

You have no idea. Hamas has been using them to target rockets.

Geoff.

Heh heh! Been there and done that. As the civilian navigator on the USNS Keithly (a re-commissioned and converted Navy cargo ship)in the late 60's, we had a number of newly-graduated "scientists" on board. The scientific and comms spaces had been converted via MG's for 120/240VAC. The staterooms were still 110DC. I shared a room with one such newby and, seeing that my Norelco shaver worked just fine, he plugged in his early style portable record player/radio/amp. When turned on, the requisite curl of smoke and bad odor emanated, ending the machine's life, early. I probably would not have liked his music, anyway. The thing is, you really had to force the plug into those DC sockets. As I recall, they're not quite the same as standard two-blade ac plugs.

My now very distant memory is that DC outlets had either one prong perpendicular to the other or both "horrizontal" where standard sockets are parallel and "vertical". Occasionally, one sees sockets made to accomodate either type of plug. I think 220V sockets also had some variation of this pattern. Plugging 120V stuff into 220 will also get some interesting, although short lived, results.

I've certainly seen those plugs. The original 28v DC accessory outlets
in our CAP-converted M-135 ambulance had the one plug rotated 90 deg
from the other to prevent problems. The thing is, at least on that ship,
I was able to get the shaver plug into the socket.. as was the other
guy?? Maybe one blade was much wider? I simply can't remember...

The NEW CC-AWA Winter Swap Meet at Mebane NC is just 3 weeks away.
This is an ALL INDOOR event, to be held at the Mebane Auction Gallery.
The doors open at 9AM, there's no need to get there at sun rise.

As always admission is FREE, vendor setup is just $5.
Tables will be provided.

Mebane is located on US 70 about half way between Greensboro
and Durham. The Auction gallery is at 7607 Us 70 Mebane, NC 27302

For complete details and a map to the location please visit the Winter
Swap Meet web page at, http://cc_awa.homestead.com/Winter.html

Many thanks to the Mebane Auction Gallery and to Kirk Cline for
hosting
this event.

I would like to restore the original connections of an LS-3 army louspeaker that I had modified many years ago, but I am unable to find the connection diagram on google.

Inside the speaker there is a high-to-low impedance transformer, but I am not sure whether both the low- and the high-impedance connections were brought to the exterior. Also, I am not sure on whether one of both transformer windings were connected to ground.

Can any one please let me know the original connections of the input three-contact jack?

Thanks & 73

Tony I0JX

The connector used is the 3-pin military mic connector, same as on the front panel of the BC-312 and '342. The high impedance side (only) of the transformer goes to the tip and ground. The low impedance speaker winding goes to the voice coil taps, only. I have come across a few LS-3's that used tip and ring but don't believe that's correct. Reason is, the LS-3 was designed for the above receivers and BC-312 receiver (only) has DC (filament) voltage on the ring connection. WA5CAB may have add'l info as he sells new LS-3s. Hope this assists you.

Just a note to let everyone know we are now stocking fresh can capacitors and complete re-cap kits for the Hammarlund HQ-129X, as well as many other vintage rigs.

We have many of the above for Heathkit, Drake, and others. We can usually custom-build cans for rigs that we don't stock.

We would be pleased if you'd look at our web-site:
www.hayseedhamfest.com and follow the link to the "Capacitors and Kits" page.

Thanks and all the 73,
Tom N�JMY. .

Tony,  I looked inside a new one, just out of the original box. NO
speaker connections are connected to ground.

Thanks for your time Jeep.

By the way, my BC-191 works fine now, but I came to the conclusion that operating with that dynamotor is really unpleasant. So I am in the process of building an AC supply.

I hope that, with the AC-powered filaments, no hum will show up in the transmit audio.

Does anyone have a manual for a Tek 1485R waveform monitor sitting
around that they'd like to trade for something else useful?

Tony, From various reports, use of the dynamotor may well be better than a.c. supplies in that the dynamotor MAY provide better regulation than external supplies. If your a.c. supply is stiff and capable of not sagging under voice peaks, etc. it will be just fine. Personally, I use one with a pair of 6336B regulators. That really helps the residual FMing of the signal. Also, try the "San Luis Obispo" fine tuning procedure for the frequency you intend to use the most. That will also quiet things down a bit.

Regards Jeep/K3HVG

Has anyone had a chance to compare side-by-side a CENTURY 21 ANALOG to a CENTURY 21 DIGITAL transceiver? I am still working on the drift problem and several I have spoken to have indicated that the drift is non existent in one or the other. Thanks.

Hi all

My Atlas needs a new knob on the band switch, the old one is broken. Where to get one?

OK Jeep, thanks for your advice.

I would not like to build a stabilized power supply, as that would be quite a huge machine. Anyway I shall give a look to the diagram and see whether there would be any simple way to feed just the oscillator tube with a separate stabilized HV.

With regard to voice peaks, using big output capacitor should help.

I am more worried about CW because, even with a big output capacitor, voltage will tend to decrease along the duration of a dash or a dot, and this may cause chirp.

Going back to my original question, the first test I shall do is to feed the filaments with a transformer, while keeping the dynamotor for the HV. I want to be sure that powering filaments on AC (instead of DC) does not cause an unacceptable hum on the audio.

By the way, I have been looking for a spare VT-25 (10Y) tube, but I could not find one for less than $70. Apparently that tube is one of those that had the disgrace to fall into the esoteric hi-fi aficionados circuit, who are prepared to pay almost any price for the promise of a "warmer" sound.

The following has been priced for a quick sale:

Icom Model IC-745 HF all band, all modes, all solid state transceiver. General coverage receiver. Duel VFO, 16 memmories. With FM board installed. New RAM battery just replaced. Includes Microphone, manual and DC cable. Never used mobile. Excellent condition throughout.

$310 includes shipping

27 amp. Regulated Power supply, 12 volts DC. Nippon America, with output meter. Excellent condition.

$35 plus shipping charges.

Antenna Tuner. Mfj-949C Versa Tuner II. Will handle up to 300 W. of RF output. With SWR/wattmeter. Owner's manual included. In excellent condition.

$ 70 includes shipping

AEA Model PK-232 Data Controller. No upgrades, no modifications. Very little use, In Excellent condition.

$40 includes shipping

All of the above equipment has been in storage (carefully packaged, in a closet, in my home) for the last 9 years or so.

Oh, Wow! Been a long time ago, but more than 50 years ago, three or four of
us,
(W7KGV, W7MGG, W7LAN and I, W7LTQ) were tinkering with BC-375's,
the 28 volt version of the BC-191.
     The power supply regulation with the dynamotor seemed to be almost
entirely dependant on the DC input to the dynamotor. If one had new, hunky
batteries, with very short (two feet max) very heavy (gauge # 000, maybe)
leads and
a constantly running battery charger, the CW wasn't too bad. HOWEVER,

my batteries were old and weak, dynamotor input leads were doubled up
#10 house wires, and one almost had to copy the transmitted CW with one
hand on the tuning knob. (Yeow, ditty, yeow yeow)

A long dash slowed the dynamotor to maybe half speed, and the glowing
filaments went from white hot to more like cherry red.

Later, an AC power supply was cooked up, using conventional circuitry
of the day, pair of 816 mercury vapors, "swinging" choke input to pi section
filter, maybe 4 microfarad filter condensers, a "smoothing" choke and a
50,000 ohm
bleeder resistor. The '375's filaments were lit with 10 volt AC
(transformer), and a
dropping resistor for the speech amplifier (10Y)'s filament. Seems to me,
there was
something about which side of the 10Y's filament was ground that made a
difference
in the hum level.

With that sucker, delivering a stiff 1200 or 1300 volts on the MOPA's
final VT-4C,
it's plates would turn a soft red blush on long dashes..... and would work
anyone
you could hear!
Old Chief Lynn

I need to remove an aluminum knob from a radio, but the Allen setscrew is stuck solid.

I've tried:

-- WD-40
-- Kroil
-- an Allen wrench with a long handle (bent handle)
-- an Allen 1/4" drive socket (twisted the Allen part)
-- blocking up the knob with rubber blocks and beating on the Allen wrench while turning
-- heating the Allen wrench with a heatgun while engaged with the setscrew and turning
-- heating the Allen wrench to 450 degrees and then inserting it into the setscrew and turning

All this and the bloody thing is still stuck solid. As a last resort I know I can drip 1-mole nitric acid into the hole, which would eat the steel setscrew and leave the aluminum relatively untouched. This I have done on aluminum car engines with snapped-off manifold bolts and it works great.

However, I can think of a bunch of ways this could go wrong when applied to a rare radio.

I would greatly appreciate any ideas.

Thank you.

73,
Jeff

I'm taking a chance that this is an obvious and dumb question. So be it:-)

In researching the S-20R I looked at the circuits for the S-40A and B, which were its successors. I've found a puzzle, namely the first audio grid bias was changed from a standard cathode bias arrangement in both the S-20R and early S-40A to a grid leak bias in the later S-40A and S-40B. Why? Grid leak bias is pretty rare in audio stages and can reputedly cause distortion. Does anyone know what H's designers were up to?

I can't find any other examples of grid leak bias in audio stages.

Go to your local auto parts store and get a reverse screw drill bit.
Drill the thing out... it will probably come out from the action of
the bit long before you get drilling toward the shaft.

>-- WD-40

I don't know what makes people think WD-40 acts as a penetrating oil.
It's not one. Kroil and PB Blaster are penetrating oils and they can
sometimes work although they are not as effective on steel/aluminum
sticking as steel/steel.

Don't know a sure cure other than drilling out the set screw. Heating the set screw will make things worse by expanding the screw. heating the knob may help. Also, I've found that Liquid Wrench works sometimes where WD-40 does not. It may take a week or two for the oil to penetrate. Put a new application on every day.

Aluminum tend to gall, this may have happened here. The result is pretty tight sticking. If you succeed in removing the screw the new one should have a bit of anti-galling compound on it. I think you can get this at most hardware stores.

Looking for just the TC201 soldering iron that goes with their TC202 station. Actually, if I could just find out what the two IC's are that are house numbered, I could likely repair the one I have.

I've found a puzzle, namely the first audio grid bias was changed from a standard cathode bias arrangement in both the S-20R and early S-40A to a grid leak bias in the later S-40A and S-40B. Why? Grid leak bias is pretty rare in audio stages and can reputedly cause distortion. Does anyone know what H's designers were up to?
>
> I can't find any other examples of grid leak bias in audio stages.

The use of contact bias in first audio stages was very common in most AA% receivers. This is not grid leak bias.. This was normally done so that the cathode of the audio tube was grounded as this was often the cathode of the AM detector. If you don't ground the detector diode you have a bias the signal must overcome. This can cause distortion in the detector. I am not sure why Hallicrafters did this on the S40B as the detector was removed from the first audio tube.

The last is one of the puzzles (that is separate first audio and detector tubes). Evidently they had some reason for it.

I am not sure what AA receivers means. Boy, it sure looks like series type grid leak bias.

     Thanks, All American is obvious once pointed out:-) I
found the S-38B has the same arrangement.

You heated the wrong thing. What you should heat is the knob trying not to heat the setscrew in the process.

If you can expand the knob even a little bit by heating, the setscrew is more likely to come out.

Jeff,

Have you tried freezing it? I don't know how large the rest of whatever it is attached to is and, thus, whether you can put it in a freezer, but freezing metals generally causes them to shrink (heating causes them to expand).

Machine shops sometimes freeze press-fit bushings before attempting to press them as it makes them a lot easier to press into the bored holes. Sometimes they will just drop in place and when the assembly reaches room temperature, they are locked tightly in place.

Barry - N4BUQ

Thanks for the correction as I meant AA5 or All American 5 like the S38.

Contact bias is the slight negative voltage developed on the control
grid if the grid resistor is kept very high like in the range above 2.2
megohms. This voltage will be about -1 to -2 volts sufficient for low
level audio signals.

Hi all,

I'm Paolo from Italy, this is my 1st post. I'm trying to align the IF filters of the R&S EK-07. From a general standpoint, I would like to understand what the recommended procedure should be. I just followed the manual:

- a sweep at the antenna input, centered at the tuning freq. I generate this sweep from the combination 141T/8443A
- the 300kHz IF output and the scan ramp output of the sweep at the scope in XY mode
- auto AGC

The filter has six fixed positions, the narrowest is 300Hz (crystal filter) and the widest is 12kHz. The - only - tube is biased by AGC. I observe large modifications of the symmetries depending on the combination sweep rate/AGC time constant: if there's enough time for the gain to get stable, I get more symmetric curves. There are three positions for the time constant: 0.1, 1 and 10 seconds. Attack and decay times are unknown. I'm missing something: what setting should I choose to perform the alignment?

Thank you and best regards
Paolo

Turn off the AGC. Adjust the gain so that it doesn't clip. Don't use
AGC during the alignment procedure.

Where are you picking off the signal strength from the IF? The really "right" way to do this is to measure the IF signal strength with the AGC _off_ and the sweep rate slow enough for the IF filters to settle (which you can check by lowering the sweep rate until things stop changing). If the radio doesn't have a diode (like the AGC detector or the AM detector) that you can use for measuring signal strength, make up something yourself.

I could see someone taking a short cut and having you measure the signal strength by monitoring the AGC voltage. I certainly don't recommend this, but if that's what the radio manufacturer wants to do you may possibly want to do it before going back and doing it right. In this case, before you go back and re do it right, you'd want the AGC set to as fast as it would go, and sweep slowly enough so the AGC settles. And redo the measurement right (did I say you should redo the measurement right?).

Thanks Bill, and to the others who responded. I've now discovered this is a pretty common arrangement. However, it doesn't seem to be mentioned in any of the older texts I looked at and neither is a gas gate tube, another feature of the S-20R and S-40 series. Later receivers don't seem to use them. I suspect they were necessary in receivers designed around the early metal type octal tubes, which, if I remember right, had a reputation for sometimes being a little gassy.

Even though the S-20R did not originally use the contact bias arrangement I will try it and compare the results with the original circuit which is the conventional cathode bias sort. The values in the S-40A should do since otherwise the circuits are nearly identical other than the RF and mixer stages. As I mentioned, the circuit diagram for the very early S-40 shows the same cathode bias as in the earlier model but its revised in later production to the contact bias circuit. Since this would not have resulted in any cost saving it must have been done to improve performance.

Thank you for your answers.

OK so AGC must be off. What made me confused is the fact that the manufacturer explicitly indicates that this alignment must be done with AGC auto.
With AGC off, the gain can be increased up to a point where the curve gets clipped and wider, this is the point then. A scan width of 1sec seems to be the limit for an optimal representation.

The receiver has a proper IF output, it is just before the AM detector diode but not immediately after the filter, in between there is a three stages, fixed bandwidth, high gain IF amplifier.

With AGC off the output level now varies depending on which IF filter is selected: the manual says that the input level should be regulated for 0dB at IF output, but this is assuming AGC on. Although I always try for maximum gain, each filter seems to produce its own maximum output level, and differences are as large as 15dB+ with no obvious logic, so no the wider the filter the higher the level. Does this make sense? How can I detect which is the "reference" level to look for or, alternatively, what is an "acceptable" difference among the filters?

Thank you and best regards
Paolo

There are a lot of factors that go into designing a filter, and for an IF filter the insertion loss is one of the easiest to overcome -- so I'm not surprised that they should vary. An acceptable level of attenuation through an IF filter is anything that gives you adequate signal on the other side, so you could have a filter that absorbs quite a bit and is still OK to use.

If by a "1 second scan width" you mean that the total scan time is one second, then you could _maybe_ get away with using a 10-second AGC. _I_ don't like it, but the manual is aimed at busy techs, so maybe it makes sense...

Thanks for info,

I have no problem at all with the dynamotor, as I power it using a stabilized computer mainframe power supply that easily delivers 100A with no voltage drop at all.

But the dynamotor is too noisy; moreoverr it becomes fairly hot if kept running for long periods.

Yes, the solution of using a resonant.choke power supply is probably the most appropriate for obtaining a stable HV, but it is not easy to find a suitable choke. Will see what I can do.

Actually there is a row in the manual that says that after the alignment the gain of the filter stage must be 30dB consistently on all the positions, 40dB with zero bias. It is written in German and I missed that row before. I will try to figure out what this means in terms of IF output level.

1sec comes from 0.1sec per division by ten divisions. If I'm getting it right, I should try to keep the gain as constant as possible for the purpose of the alignment, this is the key point I missed before.

The fact is that, at the moment, with either AGC off or AGC on, the filters are quite far from spec, sometimes the center freq is off, sometimes the top is not flat and/or the width is twice or three times than expected. There are ten trimmers per filter, sixty total.

Tomorrow, I will record the current conditions and try to make some progress.

Thank you again and best regards
Paolo

> darlington.
> --scott

Yes, using a series regulator is certainly a possibility.

With a current of up to 350 mA (average) and a voltage drop across the regulator that cannot reasonably be lower than 250V, the power dissipated in the regulator would be around 90W, which is not enormous but not negligible either.

However in my case I plan to obtain 1000VDC using a voltage doubler. So I could use two separate series regulators on each of the two 500VDC arms of the supply. This would probably make the design simpler.

Thanks for looking. I wanted to let the Halli-fans know that we've started taking orders for complete re-cap kits for various Hallicrafters rigs. We have not got our web-site updated to reflect this yet, but we are stocking all variations of the S-38, and are taking orders for the

S-40B, SX-101 variants, SX-110, SX-117, and others.

These kits include brand new multi-section can-caps (except S-38 which is a tubular) as well as any other electrolytics needed. We also can supply the kits with Mylar caps to replace the original tubular paper caps as well.

If you'd like to see what our caps and kits look like, please go to www.hayseedhamfest.com/capkit.htm . You can contact us from there, or just reply to this post.

Again, thanks for your time.

They won't be for long.

That server exists because of a "don't ask, don't tell" policy from the owners of the copyrights of many of the manuals. Legally if they can prove 10 copies of any one manual have been downloaded, they can file suit under the Berne Convention, and have InterPol knocking at their door demanding download records.

The whole process will cost the copyright owners less than $1000, and probably put the site and similar ones out of business.

If they do secure the download logs, then they have four years from the date they were first notified to sue them for damages.

If they decide to sue them or not, it does not place the manuals in the public domain. Copyrights do not need to be reapplied for, nor enforced to stay in effect. The requirement to renew them has long since been dropped.

At this point, no copyrighted US work will have its protection expire for almost 20 years, so you can't easily wait them out.

If German (and now EU) law allows the copyrights to expire or fair use as defined in the EU allows them to be downloaded, the copyright owners could force them to not allow downloads of copyrighted US manuals to US residents, which would basicly put them out of business.

IMHO the best thing the people who run the DK server can do is to remove the Heath manuals and hope it ends there.

Geoff.

Well, you are welcome to your opinion, but the copyrights
prior to a certain date in the 60s HAD to be renewed to be
still in effect. The copyright owner has admitted this, and
he has stated that a few manuals are no longer protected.

I have no bone to pick in this beef, since I usually buy the
manuals for any equipment that I own. This has all been
hashed out in the Heathkit forum on the Yahoo! users's
group (public access for reading postings) between
the users and the new copyright owner.

Those items were originally copyrighted in the 1930's and before.

Since Heath did not exist then, the first manuals copyrights dated from the late 1940's, which have all now been retroactively extended for at least 100 years from date of publication.

Anything copyrighted in the US since the release of the first full length Disney movie (I think it is Snow White) is covered.

From what I remember (does anyone have an actual citation?) copyrights until that time were 35 years and could be renewed for 35 more. Patents were 18 with an 18 year renewal and that could be a source of confusion.

If it was indeed 35 years, and the first Heath manual was published in 1947, then its copyright protection would have expired in 1982, long after the requirment for renewal was dropped and the term extended.

Outside of the US, e.g. Canada and the EU recognize both legal and moral rights and IMHO it would be next to impossible to convince a judge that the person who purchased the rights to the manuals from their owner did not have a moral right to them as opposed to some guy with a website who gave away free download privledges to other manuals in exchange for another file he could give away.

He may not be correct. The current copyright regulations are quite new and many people do not completely understand them. I am among those that do not, it is possible that he is too.

Geoff.

Either you're misreading the copyright laws, or people deeply involved
in it have misread it.

If you go to Project Gutenberg, you can find "Tom Corbett Space Cadet"
books there. They date from the fifties. You can also find H. Beam Piper
books, dating from about the same time. These are only two examples
that I've stumbled upon, but which stood out since they are indeed
relatively recent. My expectation was that all you'd find there would
be "classics" hundreds of years old.

LIke I pointed out earlier in the thread, these books have fallen out
of copyright because there was a brief period where books did not
stay in copyright unless specifically extended. And some did not bother

extending the copyrights, for whatevever reasons.

That's the premise of Project Gutenberg and those fifty year old books. Since they'be been putting uncopyrighted books into electronic form for almost forty years, one might expect them to know what they were talking about. One might also expect them to get into trouble if they had something there that is still in copyright, after all they are fairly visible and have been for a long time.

As I pointed out Jeff Duntemann has pointed out the same thing, and used the database to check on some books. Apparently Don Stoner's SSB book published by CQ fifty years ago is amongst those books no longer in copyright.

That site, I don't have the URL handy, that has old editions of the ARRL Handbook and the Radiotron Designer's Handbook and plenty of other old technical books, he's using the same premise. He's not some guy who's merely posting things regardless of their copyright, he has done checks to ensure the books are no longer in copyright. He may be mistaken about specific titles, but he seems to know what he's talking about generally.

After getting into the thing I find the dial was restrung wrong. I can't find any instructions for re-stringing anywhere. Its _not_ the same as the S-40 and similar receivers. For instance, there is an extra idler pulley next to the band spread main pulley (on the capacitor). Plus, the string must be locked on the middle idler and I would like to know the official method for doing this.

I have an original instruction book (the same as the one on BAMA) but it simply does not have restringing information and I can't find any other editions on line.

BTW, I would still like to find an original speaker or an S-40 series or similar speaker with the correct transformer on it. The one on the RX works but it has a 2500 ohm primary, right for a 50L6 but not for a 6F6 or 6V6, which want about 7K.

Also, can anyone tell me how the original speaker mounting worked? It was an elastic isolation method. This RX still has rubber washers on the mounting screws but I think the original method was to clamp the speaker and the clamps are gone. Probably not hard to make If you know what they look like.

I've resolved that this receiver has been modified too much to buzz
everything out and get it back to stock condition so am -considering-
parting it out.  Wires hanging free, etc.  The xformer is a replacement
and looks smaller.  I've taken the xtal calibrator for my good HRO-50T,
so that's not available.  The front panel looks very good, if someone
has a beat-up R-460.  On this unit, the S-meter looks to be one used on
the NC-120 or the like?  There's one "B" USCG-marked coil available.  I
sort of hate to part it but I don't care to spend the rest of my life
figuring out another's mess!!!  hi!

Is this a "plug-in" replacement? I have a 5U4GB in a Hammarlund
145XC. Would this work in the socket without altering anything?
Thanks

Thanks to Phil Nelson I got some info on the restringing and a good source of dial cord. Phil also answered my question about speaker mounting.

The material he recommends is braided Dacron fishing line. This is available at any sports supply store, I got some at a Big 5. Not expensive and works like a charm.

Just changed some tubes in my S-38 and the original 50L6GT was changed to 30L6GT by my tube supplier. I know that it is the audio output tube, but listening to it does not seem to make any difference. Is there a difference? Should I pull the tube and use the 50?
Thanks

Yes.

The first number is the voltage of the filament. Most equipment would have tubes starting in 6 or 12, indicating 6 and 12 volts, but in some equipment they had no transformer to drop the voltage down to filament voltage level, so they put the filaments in series. Since there were only a handful of tubes in the unit, they used tubes created for the purpose, which had higher filament voltages.

The 50L6GT requires a 50volt filament, and thus uses up just under half the AC line, making it easier to drop the rest of the voltage. It was common to have rectifier that used 35v on the filament, which then totals 85 and only about 30 volts more were needed. That can be made up of 12 and 6 volt filament tubes.

By using a 30L6GT in the radio, you've caused all the other tubes to see a higher filament voltage. At the very least, that will cause a shortened life for the tubes.

Michael VE2BVW

Add up the tube filament voltages and see which tube is closest to what your line voltage. I'd think that the 50L6 would be preferable.

Firstly the tube that was changed by your supplier should be a 35L6 not 30L6 (to my knowlegde the 30L6 does not exist).

Secondly the 35L6 and the 50L6 are not exactly the same tube with a different filament voltage, As a matter of fact the 50L6 is a slightly more powerful tube, as witnessed by its somewhat higher power dissipation and by the fact that, despite the higher filament voltage, its filament current is the same as that of the 35L6 (that is 0.15A). This means that the 50L6 has more cathode emission.

In any case, using a 35L6 instead of a 50L6 causes the filament voltage of all tubes in the series string to be too high by some 10%. If you have not used your radio with a 35L6 for a long time, I believe no damage has occurred, but it would anywy be wise to use the original 50L6.

Regards.

Tony I0JX

With American tubes, the numbers at the beginning are the filament voltage, the numbers at the end indicate the number of elements in the tube, and the letters in the middle are more or less random.

The 50L6 and 30L6 tubes are variants of the classic 6L6, built with higher voltage filaments for series string radios. If you put a 30L6 in place of a 50L6, not only will it fail prematurely from the high filament voltage, but so will all the other tubes in the radio because they will also be seeing high filament voltages.

You _can_ make it work by increasing the value of the series resistor on the filament string to make sure all the tubes are seeing the correct filament voltages. If you do this, write a note inside the case warning

```
future users of the equipment about the modification.

Why did you change the tubes in the first place?  The old ones are
probably all fine anyway.

Tony,
Thanks, it was a 35L6, a typo.  Put the old 50L6 back in, it basically
```

```
was just the rectifier tube that caused the problem, so I will not
mess with what is working!
Thanks

Tio,
Thanks for the advice. It was a 35L6, not a 30L6, but I put the 50L6
back in, it was not the problem, it was the rectifier tube, don't fix
what works, right?
Thanks

Scott,
I changed the tubes just to make sure, even though it was only the old
rectifier tube that went belly up. Plus, it was 35L6GT, just a typo.
Put the 50L6GT back in, and it was still good. The replacements were
only $5, so now I have some guaranteed good spares for later.
Thanks for the reply

The 50L6 is NOT a relative of the 6L6. It is a pentode
power tube with 10 watts of plate dissipation compared to 19
watts for a 6L6. The 6L6 puts out about 2.5 times the power
when operating as a single tube Class-1A aplifier. Other

characteristics are also different.

The 50L6 was intended for use in AC/DC "5-tube wonder" receivers usually with a 35Z5 rectifier and three 12 volt tubes for the remainder for a filiment drop of 121 volts. There are equivalent (but not identical) miniature tubes to serve the same functions. There are also some lower voltage heater rectifier and power output tubes for use in AC/DC receivers with additional stages. Actually some fairly advanced AC/DC receivers were made, for instance, the National NC-45 and NC-46 , which are 9 tube AC/DC receivers with two IF stages and push-pull output. Both have series string heaters with a total drop of about 120 volts.

I used to think that too, Scott - but look up the details some time.
They are not at all like the 6L6.

Yeesh! That is not good at all! That is a very misleading number in
that case.

What about the 25L6 then? I have pitched a lot of 25L6 tubes
over the years because they showed low transconductance compared with a 6L6.

Its identical to the 50L6 except for the heater voltage and current.

The numbering system for tubes was intended to be systematic but broke down pretty quickly because of the plethora of new tubes. The earliest system was chaotic with numbers but also prefix letters usually indicating the manufacturer. For instance, RCA prefixed its tubes with UX so a UX-210 is a 210 tube made by RCA but others also varied the numbers, I think DeForest used 5 in place of 2 so a Deforest 210 became a 510. The number-letter-number system began sometime around the early to mid 1930's. I used to know the exact date but its evaporated. Note that while the first number usually indicates the filament voltage that is not always true. For instance, Philco and others made "locktal" tubes, a variation of the octal type but with plain wire leads and a sort of locking base. These usually have a 7 as the prefix of the type number but mostly have 6.3V filaments. As usual in life chaos reigns supreme.

AFAIK the numbering -- other than the filament voltage, and other than
suffix letters -- is almost completely arbitrary; any similarities in
functions between similarly numbered tubes in a marketing, rather than an
engineering, decision.

Even then, as Richard pointed out, the filament voltage sometimes isn't,
and a 'G' variant of a metal tube often has different interelectrode
capacitances than the parent tube or the 'GT' variant.

Other two cases of inconsistency:

- the old 814 made by Taylor is a transmitting triode, whilst the 814 we all know is a power tetrode.

- the 6BN8 is a noval twin diode - triode. But there also is an octal 6BN8 which is a twin-diode pentode.

Personal opinion of mine...I think the * manufacturers* intended a
35/50L6 to be a DESIGN replacement for the old 6L6 as applied to AA5
50s-60s radios. Walks the same walk but its a 150 volt tube.

No question about it....its not very closely related if you're looking
from a conventional 6L6 perspective. 25L6 is sort of a different animal
not related to either of the two.

The characteristics of the 50L6 are so completely different from a 6L6 that its obvious that it was a purpose-designed tube. About the only similarity is the use of beam-forming plates to get higher efficiency than is possible using a conventional pentode. This design originated about the mid 1930's. I am not sure which tube employed it first, perhaps the 807. In some ways the 6l6 can be viewed as a single-ended version of the 807 although there are some differences other than construction.

Also, most of the early octal-based tubes were derived from previously available large pin base tubes. I am not sure about the 50L6 although there were high-voltage heater types available previous to the octal base intended for similar applications, i.e., AC/DC receivers.

According to the _RCA Receiving Tube Manual_ edition RC-19, the 25L6 is identical to the 50L6 except for the heater rating.

There were modified versions of the 6L6: the original was a metal-shell tube but was followed by the 6L6G which originaly had a large partly pear-shaped envelope, this was followed some years later by the GA, GB, and GC versions. The GA has a low-loss base but there are other changes in the latter versions, mainly increases in screen grid dissipation. The GC is essentially the same tube as the 5881. This tube was intended for service in circuits such as the "ultralinear" audio amplifier where the screens are operated at the same potential as the plates, a condition which will cause short life in a standard 6L6.

The manufacture of tubes is fascinating and much more complex than appears on the surface requiring the services of many specialists such as metalurgists, glass specialists, etc.

There are two internal RCA training manuals about tube design and manufacture on Pete Millett's web site at:
http://www.pmillett.com/tecnical_books_online.htm

Which also has a great deal of other stuff of interest to boatanchor types including the 4th edition of the _Radiotron Designer's Handbook_.

You're welcome:-)

FWIW, here are some common combinations of tubes used in 5-tube AC/DC sets. These were typical but its not an exaustive list, there were other tubes designed for series string operation directly from the power line. In England and in Germany other tube types were designed for the same purposebut operating from 230/250 volt mains. In fact the famous and rare original tube used in the famous Telefunken/Neumann U-47 was originally intended for such use. It was chosen because the filament could be run off the microphone bias voltage, an economy move since it elmininated the need for a separate DC filament supply:

C.1934, from the RCA RC-12 tube handbook:

6A7	Converter
78	Remote cut-off IF amplifier
77	Combination dual diode and triode (detector, AVC, first audio)
43	Audio output
25Z5	Rectifier

Plus 150 ohm, 10 watt filament dropping resistor

From the RCA tube handbook RC-19 (1959)
Miniature tube types

12BE6	Converter
12BA6	Remote cut-off IF amplifier
12AV6	Combination dual diode-triode (second detector-AVC-first audio)
50C5	Audio output
35W4	Rectifier

Two other examples:

Hallicrafters S-38B, a five tube set typical of many of the early 1950s.

12SA7	Converter
12SK7	Remote cut-off IF amplifier/BFO
12SQ7	Combination dual diode-triode (second detector, AVC, first audio)
50L6	Audio output
35Z5	Rectifier

The original S-38 was a six tube set with an additional 12SQ7 tube as BFO and noise limiter. In the S-38B the BFO was obtained by allowing the IF stage to regenerate, a circuit patented by Hallicrafters and the ANL was eliminated. I am including the S-38 because it is an application of the 35L6.

S-38 (c. 1949)

12SA7   Converter
12SK7   Remote cut-off IF amplifier
12SQ7, No.1 Combination dual diode-triode (second detector, AVC, first audio)
12SQ7, No.2, BFO and Automatic Noise Limiter
35L6   Audio output
35Z5   Rectifier

Note that the filament drop here is 118V and in the five tube circuit its 121 volts, all close enough to the 110V to 120V range for AC current at the time these sets were in use. DC voltage was common in some cities, notably New York, I think at around 110 volts. DC was convenient for operating traction motors of the sort used in elevators so it was continued until a surprizingly late date. DC was also available in some other US cities but its beyond my recall which ones. 110 VDC was also common on shipboard.

110VDC on ships, Oh yes! Partner and I repairing radar
on one such ship, bravely plugged in our trusty Weller
soldering gun and pulled the trigger. Nothing for a few
seconds, and then a little curl of smoke. When trigger
was released, it hissed, breathing fire and sparks out of ALL
the air cooling vent slots. Throwing it on the deck and
stomping on it only aggravated the fireworks. Stone
faced Skipper calmly pulled plug from wall, and I think
he lost some admiration of our technical competence.

Shame that replies sometimes take a few hours to saturate the planet via
Usenet.  The man's AA5 * could be saturated in flames* before he has a
chance to read this thread. :)

If its not too late, bub, just throw it out on deck and let the
"skipper" aka "wife" unplug or stomp on it.  We're not talking a Julien
Creek mega model that can't be killed, are we?   Jess like The Old Chief
said.

> on one such ship, bravely (snipped)
> Old Chief Lynn, W7LTQ

Oh whit, mind my manners.  What was the question?

-Bill

It's a pleasure to be part of this group. I just purchased a National
NCX-3 that is very close
to mint condition. It has been calibrated and realigned. Just has a
few small problems that
need to be addressed. Anyone wish to talk about this rig.. Please
post. Thanks!

I pulled out the HB-3 for this and wow... it sure IS different.  Only
8.5 watts dissipation, versus 14 for even the baby 6V6.

>No question about it....its not very closely related if you're looking
>from a conventional 6L6 perspective. 25L6 is sort of a different animal

According to the HB-3, the 25L6 has ten watts which is a bit more than the
50L6.  Mine does not have a page for the 35L6 but there is a note saying
the 35B5 is an equivalent.

@i24g2000prf.googlegroups.com:

> It's a pleasure to be part of this group.

Contrary to what you might think, this is not a Google Group. This is
Usenet, something which predates Google by a few decades. Google
shamelessly tries to make people think that Usenet is part of their Google
Groups hierarchy. It is not.

You don't join this group, you participate in it. Do yourself a favor and
"Google" (hate how that word has become part of the lexicon) 'Usenet."
Educate yourself about what you are posting to.

I'd like to note here that while Usenet is generaly unpoliced, except for
moderated groups, Google does such a poor job of preventing SPAM that many
people have set their newsreader programs to automaticly ignore postings
from Google.

This is done by placing a pattern which recognizes Google groups as the source
of the message in a file, called a killfile, which causes the messages to
be "killed". They are not canceled or deleted, just ignored.

So the chance of your postings being read is much smaller if you post from
Google than anywhere else.

Geoff.

Hi Matt:

I had the pleasure of owning one (new) a number of years ago. At the time it was my first transceiver... And my first venture into SSB operations. I always thought that is was a well designed and engineered rig. Heavy duty as well, from the overall construction.

I maybe able to answer questions...

TNX

Hi Matt,

Welcome.

Its been many years since I had my hands on a NCX-3. One of my buddies back in the early 70s had one and it seems like he was often fiddling

```
with it trying to cure some spurious things in the final stage.  Could
have been choice of tubes, neutralisation, etc.  Don't recall.

What sort of problems are you having?

I posted here mainly to discuss the beauty of this radio and my
pleasure
of owning one. The problems are very minor and I have a friend who
restores
boatanchors. I do appreciate the offers for assistance but I do think
that
we have it under control. The gentleman who does this work in Denver
is a real pro. Thanks for the interest. I am a fairly new ham but I
love this
vintage equipment.

A non-r model with bandspread and main tuning on one knob. Looks nice,
somebody (sensibly) cut the power cord. You also get an S-19 as a
parts unit to keep the S-20 running well into this century.

$75 obo. Photos upon request.

I am the recipient of a reasonably nice, 6' rack, HB transmitter, two T200's modulated by two 810's. Its a real behemoth and is of a design from the 1943 Handbook with the exception that the low level speech equipment is solid-state. Are T200 tubes still available, anywhere? I do not see any of these advertised, anywhere? I'm not afraid to use the ones provided but it would nice nice to know that spares are still out there.

Thanks   de K3HVG

I'm restoring an AN/FRR-24 triple diversity HF receiver - all 3000 lbs
of it.
I need a few more rack-mount modules -
CV-127/FRR-24 FSK converter with scope
PP-648/FRR-24 & PP-649/FRR-24 power supplies
(any FRR-24 or FRR-37 power supplies will be helpful)

Also looking for rack-mount modules for AN/FGC-5 and AN/FCC-3
telegraph (TTY)multiplex systems.

I have for sale a nice Collins PM-2 Power Supply for the KWM2(A). It is
```

Round Emblem and comes with all the hardware to hook it up including the nuts that go in the KWM2. It works great. All voltages have been checked. It does need an AC power cable. The one on it is safe. The inter insulation on the wires is good, but the outer insulation is peeling off. Cosmetics are good. It has some small scratches, but does not look bad and the paint is original. Price is $185 plus shipping from 79602. Pictures available.
Thanks, Charlie Hugg, K5MBX CCA 307

Hey OM

I should has learned to play the guitar. Instead I got into
electronics built my first xmitter in '67 using a 6BQ5 xtal osc and
6146A final.
Everything was hot. I used series twist lock caps in the ps, B&W coil,
with aligator clip adjust, multi elmac plate and  tune caps, a tv set
power xformer, all that on a punched out 5x7x2 LMB chassis. Even the
Key was hot as I keyed the screen of the 6146A.

That's pretty impressive, fitting that on a 5x7 chassis!

The Hallicrafters SR-500 utilizes a pair of Tung-sol 8236s.

The 8236 seems to be identical to the 6DQ5, except for plate dissipation (50W against 25W) thanks to the use of a carbon plate.

The 8236 seems to be available nowhere.

Any suggestion where to find them?

I think the 6DQ5 plate voltage is lower.  Rare tube, they show on eBay
every so often. They were used in the Clegg Apollo as well.  I looked
at a few suppliers I use and no luck.

Your best bet is ebay or trawling round the hamfests but like any
special tube they will not be easy to find or cheap, I'm looking for a
8873 for my Heathkit SB230 if anyone has a few going spare ....

If you can't find them you may need to look at converting to something
more readily available. Is there room for a pair of 6LQ6's? if not a
pair of 6146B would be a good choice as they will take a KV and can
still be obtained NOS, the GE 6146W that is sold cheaply on ebay is fine
with 1100V on the anode and 280V on the screen (You will need a small
computer fan to keep them cool)

Steve H

You didn't look far. http://www.tubesandmore.com/ has them. Granted,
it's over $80/ea, but "way expensive" is different from "not there".

(I wish I got a kickback from those folks, I really do).

That's pretty impressive, fitting that on a 5x7 chassis!

(Actually 5ft x 7ft !) ;-)

My neighbor gave me one of those 5 tube AM BCB radio kits back when I was a kid. It was part of an electronics correspondence course he was taking. The idea was to put it together breadboard fashion on the schematic then when you got it working move it to the chassis. I thought it was cool just keeping it on the breadboard and hauled it around for years until it finally got stolen out of storage about 20 years ago. Over the years I had tested several mods on it. HF converters, adding another IF stage, a BFO, Q multiplier and reworked the series filament string for parallel operation. I'm sure if it was still around I would still be tinkering with it.

Jimmie

I didn't build a transmitter when I got my Novice License (in my teens), though I did start collecting parts to do so. I was going to build a rig using a 6GK6 oscillator and an 807 final. But, on Washington's birthday I went down to Harrison's in NYC for their big yearly sale. They had a stack of Elmac AF67 transmitters for about $15 each, so I got one. I had to build a power supply for it though. This I did using a junk salvaged from old TV sets found curbside on garbage pick up days.

I used to ride around the neighborhood on my bicycle looking for thrown out TV sets. I carried enough tools with me to pull a chassis out of a cabinet and lug it home. Then I'd tear it apart in the basement and keep the goodies.

Seems all of those AF67's had the same problem, burned out modulation transformers. But they worked great on CW with crystal control. Some of them also had bad VFO's.

Years later when my brother got his novice license we found him a used Lafayette HA350 receiver and I built him a two tube transmitter. Actually I used parts from my now defunct AF67 stuffed into a large minibox as a chassis. It used the 6GK6 (from the junk box) and a 6146 in the final (from the AF67). I wonder if he still has that transmitter lost in his basement? I might want it (and the HA350) back.

No,
 Drake stopped servicing all Amateur Radio products about 4 years ago
and sold off the parts inventories.

I'd check and see why that 5 volt line is low or what is pulling the
supply line low.

Apparently Heath has sold the rights to its legacy
equipment, including manual copyrights. All of the
Heathkit equipment manuals are pulled from BAMA

and from several other web resources! This sucks.

Pete

For a company that was built on, very often, selling poorly-designed crap to people they have their nerve.

This will make the photocopied manual industry explode with attendant price

increases. Sadly it will diminish the value of
the decent pieces of equipment they manufactured many years in the past when
they were not so mean-spirited and greedy.

I must say a leopard doesn't change its spots. Last time I was in Home Depot
I saw the Heath line of garage door openers and home products and it all
appeared to be low-end Chinese made versions of the items made by quality
companies.

I also was amused at some kit company advertising in qst magazine this
month. It's advertisement is a near identical copy of the one Heath use to
run in the 1960s with its , David Nurse, sitting in the same pose and using
the exact phraseology used then. Is no one original anymore? Hopefully that
is where the similarities of that modern day Heath-wannabe company end.

Well... My SB102 was a poor man's KWM-2. Several pieces were Spartan but
useful. A real good learning experience in building and troubleshooting.
Most of the stuff is too old to be of any serious use except the HF amps.
Nice crackle finish. Best remembered in photos now. I wonder what people
will think of "Vintage MFJ"

I found this:

Probably the same thing they currently think of MFJ.

I have been given a Galaxy 1000 linear amplifier by my brother and need it's manual or any information on how to operate it and use/availability of exciters. It has 4 Horizontal Sweep Tubes w/hat that are functional. I'd like to know the Plate Tuning and Antenna Loading procedures. There's also an "adjust-for-maximum" knob on rear of amp. Any specific/general information you can share will be appreciated.

Actually, there seems to have been a period when things could fall out
of copyright. Not the obvious early 1900's, but around fifty years ago.

Jeff Duntemann (who wrote a great article in "73" way back in 1974
about the time he advertised for old electronic junk) wrote about
this on his blog a few months ago,
   http://jeff-duntemann.livejournal.com/134918.html

This accounts for that webpage with old technical books on it, they
really do seem to have fallen out of copyright. Jeff mentions books
like Don Stoner's SSB manual that was published by CQ about fifty
years ago, as an example.

Note there is a window when this could happen, and it requires that nobody renewed the copyright. So it's not automatic.

In the US and much of the rest of the world, this extended copyright is a part of the Mickey Mouse legacy. The 1923 date, not coincidentally is the year that Mortimer Mouse, Disney's first ancestor to Mickey was created. When the copyrights and renewals for Disney on Mickey (his first creation) were about to expire a number of years ago, the US Congress, heeding pleas by Disney that "we don't want Mickey Mouse's image to end up in the hands of spoofers, satirists and pornographers" extended the copyright provisions, provided that the owners extended the copyright by renewal. Active companies, such as Disney, maintain teams of intellectual property lawyers to ensure these are renewed. Inactive companies, such as the various now defunct publishers of these tech manuals have no one with a vested interest to look over renewals.

Some of this copyright stuff later got extended into international treaty. I'm am a symphony orchestra violinist in another life, and most of the music we play written after 1923 is covered by copyright. Like tech publishing, this was not always the case and some interesting things happen.

Several of my orchestras play "Peter and the Wolf" by Russian composer Prokifiev every year at our kiddies concerts. One orchestra bought its parts during the time it was not under copyright protection. We can play "Peter" freely and pay no royalty. My other orchestras have to rent the music (you can no longer buy the parts) and royalty fees (rather stiff ones) are built into the rental fees.

They upshot of this is that my orchestras are far more reluctant to play "modern" music. As community orchestras we have limited budgets. All the players are volunteers. In order to pay for these royalties, we usually seek out grants, sponsorships and donations when we wish to perform modern works, on a case by case basis. We give acknowlegement in the program (this performance was underwritten by the Amalgamated Tiddley-Winks Corporation).

Music publishers and the various artistic licensing groups (ASCAP, BMI) charge a sliding scale of royalty fees based upon the orchestra budget, size of the venue, auditied average attendence, pro or non-pro etc. etc.

So we can all thank Mickey. Kudos to those firms which own copyrights, but are willing to grant permission to select groups to freely provide some of their radio data to websites dedicated to the boatanchor crew.

Jon

There are pros and cons on the copyright question. I also remember that there was a Supreme Court decision back in early 1900s wrt book publishers wanting to make it illegal for a person who bought a book to sell that book on the used market. Good deal for the publishers; they get to sell more books at full list price and anyone who doesn't want his old book can't sell it. Maybe could give it away?

In the new modern world of IP theft, what is already happening is that a variety of crooks just go ahead and reproduce (common in China, maybe India, too) any IP they feel like and get away with whatever they can until its time to move and set up shop in a new neighborhood. The articles I read talk about an illicit market worth -- like -- $trillions per year.

I was at an art museum many years ago and in the exhibit you were not allowed to take pictures (by a large sign posted near entrance and exit), but down in the giftshop you could buy any number of any published books, large/small, cheap/expensive, on that exhibit. Its all about money? Right?

If it gets bad enough, then businesses that depend on IP protection will go out of business and buyers might be getting defective products. The music copyright can get into rediculous cracks: I heard that there was some kind of girl scout meeting or outing where they wanted to sing some song that was copyrighted but didn't pay or get permission and some "association" sued their butts over this. I don't remember the details, but I had a sick feeling in my stomach over this. So, where is society headed? You have to pay (?) 90% of your net earnings for all manner of legal advice on what you can do or not do, and the remaining 10% of your net earnings will go to the inventor/licensor of your patented toilet so you, as licensee, can pay royalties every time you take a crap?

Patent flooding is the new scam. You patent the living daylights out of anything you invent. Then, we've got patent troll companies, buying up patents so they can find a basis to sue someone over some obscure violation and that is how they make money: settlements. Then there is another scam: patent club companies. They buy up patents, too, and get membership fees from client companies and instead of paying royalties, get free access to licenses as a quid pro quo on the membership fee, and this is supposed to protect them from lawsuits.

Is it ever going to end? Or, are we, in the future, going to suffer nervous breakdowns from "legal stress"?

You've heard of "house flipping" in the real estate market? ;-)

This looks like amplifier flipping. Some of these guys read the obituary columns and the silent key lists, then go offer the widow 5 cents on the dollar, if you get my drift.

Couple years ago I was looking for rigs and read the stuff on eBay, too. I always had this funny feeling that "it works" meant that if you turned on the switch, you might get some noise out of the speaker or the pilot light went on without blowing the fuse, and not much more.

Take your extra money and go to hamfests instead. Maybe someone should write up a list of things to look for when the box is right in front of you and questions to ask before you start haggling. Auctions always seem to get more blood out of a turnip than the turnip can possibly hold.

Pardon my skeptical attitude. But, I build homebrew gear now.

If you don't find one, you could try the amfone.net group...
They have a technical forum and a lot of Johnson users.

New problem, which I had before and fixed when I reloaded XP.
I don't want to go through again!

I can download files direct from the Bama.sbc.edu site, which
```

appears to be a FTP file transfer... When I go to Edebris the
files download to a download window but they are corrupted
with only 0 bytes. Oddly, I can go to the mods.dk site, and
download manuals with the correct byte size that can be
opened and viewed. Any clues? I've read where others have
had the same issue, but no one has reported a fix. I suspect an
automatic windoze download did me in...

Pete

I noticed it too the other day but someone had said Heath data was removed
so I thot nothing of it. I have high security rules in my firewall so I
keep remmed lines in the rules for when I FTP or do other specific chores.
I haven't had trouble with other sites though. It's a big mistake to start
tearing apart your own installation because of some website glitch.

I also have sometimes had this problem. Try a different browser and see if that makes any difference, i.e., if you

are using Firefox try IE. Also, some security settings won't
allow you to download unless you override them.
    Computers are supposed to be automatic an make life
easier, right?

You should be aware that each BC-221 and the other heterodyne
frequency meters had its own individually plotted calibration book so
using one from another meter wasn't an accepted practise.

Still, if you don't have any calibration book anything is better than
nothing.

There is an excellent article with photos of the original equiupment
used to calibrate the BC221.It appeared in the Christmas 2008, Issue No.
116 of the UK Publication Radio Bygones. (www.radiobygones.co.uk

www.radiobygones.com)

The article is based on a reference in the May 1944 edition of
"Electronics" (U.S. magazine???)by Philco Engineers which described the
calibration procedure in detail

Those people were really clever!!!

We went through this already.

Like I said when this thread started, all the warnings about them
being useless without the calibration book dates from a time when
calibrating them would have been at the least tedious, and of course

few had any good frequency standard.

Pete mentioning that there were articles about calibrating them
yourself is interesting since I've never seen any such thing,
clearly at the cusp of when they were available people did
go to the trouble, but later nobody bothered.

Nowadays, it's a different matter, since anyone with a frequency
counter can live without a calibration book, or at least make
up a calibration book far easier than sixty years ago. They likely
have access to a very good frequency standard too.

Precisely. The thing is, with a good counter you don't need a BC-221
any longer.

I am looking for the two connectors mounted on the BD-77 / PE-73 dynamotors.
They are identified as SO-39 and SO-41, and mate PL-59 and PL-61.

Does anyone happen to have a non-functional dynamotor?

I would pay $40 + shipping for both connectors.

Nope... that wasn't correct.  It says Published by Amalgamated Wireless
Valve Co. of Australia but printed and bound by the folks at Billings
(London) and dated 1954.  I guess that's how they did it?

Those of us having a HQ always wonder what happened to the original
wide felt feet sometimes more than not missing, or worn down.

Maybe not perfect but these work great small plastic feet with perfect
sized screws:.

ACE HARDWARE BUMPERS   PN # 55930

The hole where the screw goes can be plugged with felt or I used small
rubber picture frame wall protectors.

73 and good DX-ing

"on those old boatanchors............ no microprocessor noise,
etc...."

The particular receiver Theo was asking about uses a 6SQ7 dual-diode, triode as a diode detector. I found it in the 1950 Radio Amateur's Handbook.

The schematic may be a bit misleading, though, since it shows a schematic of the diode transformer that is the same as an if transformer - which is tuned primary and tuned secondary - with the full winding on the secondary used for the diode. I found this concise statement in the 1942 Editors and Engineers Radio Handbook "Diodes load the tuned circuit to which they are connected, however, and thus reduce selectivity slightly. Special i.f. transformers are used for the purpose of providing a low-impedance input circuit to the diode detector."

If I were winding the i.f. transformer, I would use a hi-q secondary and tap down for the diode, so that selectivity is maintained, while properly matching the diode input impedance. That may be how the transformer is connected, although it does not show that on the schematic.

Colin K7FM

Not sure, it might be an English edition. The title page of the RCA edition says:

Published by the Wireless Press for
The Amalgamated Wireless Valve Company PTY limited
47 York Street, Sydney, Australia 1953

Since the RCA edition was reproduced by photo-lithography this is likely what the Australian edition says. I take "published" to mean printed and bound. I suspect the English edition may have been reproduced by photo-lithograph in the same way as the USA/RCA edition was. In both cases it would be much cheaper to print and bind locally rather than ship complete books from Australia plus the Ausies may not have had a large enough printing facility at the time since the entire population of Oz was probably not more than ten million.

The main sign of the photolighography I see is a slight clogging of some of the charts. Not a big deal.

This was a magnum opus and I doubt if anything like it will ever again be published in its field.

RCA, like Kodak, was an extremely good source of educational information. For instance, the tutorial on vacuum tubes in the front of nearly all of the receiving tube handbooks is excellent.

We didn't appreciate this stuff when it was available.

I was given the third edition of the RDH by an engineer I knew when in my early teens. When the forth edition was published I bought one immediately, I still remember doing it. It came in the proverbial plain brown wrapper which, of course, soon got lost. Its a book you can cuddle up to and read over an over. I learned a great deal from it. It also has a very exensive bibliography and many of the citations are worth looking up.

K.R.Sturley's book, also available on Pete Milette's site, is also worth having. It concentrates on radio receiver design but, even though both of these books were written before solid state electronics much if both are still applicable, for instance filter design, etc. I strongly recomend poking around on Pete's site, there is a lot of valuable stuff there.

FS: A like new in the box Bird 43 with a Bird PEP module installed. It is spotless and works great. It has the dummy slug and the original manual. I want $395 for it. I also have a Bird 1000W HF slug for $120. I will sell the pair for $475 plus shipping from 79602. I can send pictures if your interested. Thanks, Charlie Hugg,
K5MBX

Colin
The diode load resistor in most of the diode detector circuits I'm
familiar with have several hundred kilo ohms and I think 6SQ7 diode has
a few hundred ohms so the total reflected impedance to the last IF is
the pretty much the resistive load. And if my 68 yr old memory serves
me right most commonly used IF transformers had an input and output part
number and in some cases interstage but that may have been for TV IF. I
don't recall replacing many transformers because they failed
electrically but because the little ferrite core with a hex hole would
crack and could no longer be turned. Many times this was because of a
previous repair where a monkey not a tech, tried to tweak it and broke
the core.
I also worked on a one set that had the first IF transformer installed
backwards at the IF mfg factory, not the TV assembly plant. That took
some time to find considering the test eqpt at hand was limited to a
vtvm and an audio scope.
Time to stop rambling and ask if the ARRL article distinguished the IF
transformers with different part numbers?

"Time to stop rambling and ask if the ARRL article distinguished the IF transformers with different part numbers?"

Yes

The first and second stage transformers are designated "456 kc interstage if transformer, permeability-tuned (Millen 64456)". The third if transformer (to the diode detector) is designated "456 kc diode transformer, permeability-tuned (Millen 65454)".

The schematic drawing for all three transformers are the same, but the secondary of the last transformer would be different to attain a lower impedance.

Colin
Good on yah mate..
Now to express it another way the winding ratio of the diode transformer has to be such that when it reflects the diode and its load to the plate of the last IF, the plate circuit will see the correct impedance for the IF tube load. Transformers don't have impedance, only turns ratio to

reflect back whatever impedance they see in accordance with the turns
ratio.

I hear ya! Most of these discussions leave the tracks in a hurry and wind up out in the cornfield.

We don't know if a bfo or product detector or regen or filters or a converter stage involved. Everybody else seems to have thrown the book at him.

Yes the 6AV6/6AT6 (or the E series equivalents) come to mind.

And the AR8 also has/had the unusual 'Mazda Octal' base; which looked,
at least at first glance, like an International Octal, but wasn't.
The centre spigot is larger.

Remembering to my cost some 50+ years ago (1953 I think?) when building a radio from scratch from war surplus, I used the wrong tube socket and had to desolder and rewire in a proper octal.

Also, musing, I recall two other problems with that set. a) I needed a tube without a top connection and bought a 6SS7. b) Took it away on an installation job the lodgings ended up in part of the City Of Gloucester (UK) which at that time still had 230v DC mains.

Never could explain to the landlady that "Oh yes there wasn't such a thing as AC/DC mains. And that it had to be one or the other". Moved lodgings shortly after; for other reasons!

The DC nearly blew the power transformer out of it! Fortunately it was a sturdy ex-Admiralty Parmeko or something which I may still have buried in another old power supply downstairs?

FS: PALOMAR M-840 SWR/PEP WATT METER. This Palomar swr/watt meter has dual scales, and a remote sensor. It works fine ,with wall wort supply. Meter ranges are 20,200 and 2000 watts. Cosmetics very good,has been stored for many years.I don't see a mark on it. Has 2 vertical led scales one/watts and one/swr. I am asking 85.00. Thanks. Charlie Hugg, K5MBX

Two cents worth...

Although I don't consider the Ten Tec Century 21 a boatanchor (to me it's a pretty new rig, in fact it is the most "state of the art" rig in my shack)...I seem to work a lot of like-minded vintage aficionados who use them as their "grab n' go" rig. For years I have read the complaints about it being a drifty transceiver but its excursions never were problematic due to my very occasional and short-term operations. Although my Century 21 saw only brief periods of use while on vacation trips I recently rebuilt the jumpy PTO and have spent more time with it following that project as a "shake down cruise" more than anything else.

Indeed the Century 21 drifts. Mine tended to drift about 1/2 kc per hour. I searched the blogs for some guidance but found nothing other than complaints about its drift. Finally I emailed the service department of Ten Tec and my one sentence reply was, "Sounds like a voltage regulation problem."

Duh.

Suffice it to say that for the last week I have been running tests on it with voltage probes connected to various key points of the circuitry and did not see any discernable voltage fluctuations while observing drift with my frequency counter and ear. Then I burned my hand on the 1872 incandescent bulb that illuminates the meter. Could this be heating up the innards causing the oscillator components to morph? So I simply removed the 14 volt bulb that produces 120 ma for a total of 1 1/2 watts of power. I then replaced the cover. No detectable drift has been observed on the frequency counter for 4 hours now. I'm going to let her cook all day and tonight I'll give it a good CW thrashing when 80 meters comes alive.

If indeed this simple fix holds it seems almost too easy to work. And there's my two cents worth.

That incandescent bulb is an 1982 NOT an 1872. Guess I need to get my
eyeball nuts tightened.

Then as soon as you start transmitting for long periods of time and the
finals heat up the rest of the radio...

If this is really the case, then ovenizing the VFO enclosure may be a
worthwhile endeavor, even if it reduces the O/A reliability of the set
slightly (hot things always break quicker). Come to think of it, if you
"ovenize" it with a TE element you could maintain the temperature at

something like 75 or 80F, and not affect reliability too bad, assuming enough capacity of the TE element in cooling mode.

Man, I'm trying to type this darned posting in too much of a hurry...

OK...breath...

the bulb is an 1892, NOT a "1982" NOR an "1872".

Sheesh.

Anyway...TAKE THE DARNED BULB OUT OF THE METER and see if your drift diminishes.

Thats fine for untuned transformers, but surely in the case of these I.F. transformers that consist of mutually coupled parallel tuned circuits, this must be different?

Theo,
Could they be "Miller" transformers?
They made lots of stuff like this.......   but, sorry, I have none in
junk pile right now, but remember several new "Miller" items with
similar descriptions that I tossed last year. (can't be sure about
the part numbers, but the technical description matches)

The two IF transformers should be easy to get because you can probably use
scrap ones out of old radios.  Alternatively you can make your own:

http://www.angelfire.com/electronic/funwithtubes/IF_Can-1.html
http://geek.scorpiorising.ca/455KHz.html

They won't be exact equivalents to the Millens but they will work
reasonably well.

I'm not sure about the BFO coil offhand.

After 8 hours of "cooking without the meter bulb" the receiver has drifted less than 100 cycles (50-80 cycles nominally) , far better stability than before. To preclude any heating from the finals during long transmit periods I am going to experiment with moving the finals to the outside of the year of the case. I'll post my results here for anyone who is interested.

I had this idea a while back, to thin out my stuff in what I think is a useful and interesting way. Along the way I ended up having to buy a bunch of new stuff as well (e.g. the brand new tune and load variable caps). So take a look - might be a fun way to spend some winter evenings.

A tuned circuit is a reactive load just like an untuned circuit except
its reactance is max at the desired frequency.  Any DC resistance such
as the diode and it's load are undesirable as they lower Q.

Not really a boatanchor question, but I am looking for some of the old
Motorola MC2831 FM transmitter chips which were discontinued a decade or
so ago.  I'd take one of the MC2833 chips which are similar (they have a second
dedicated transistor instead of a tone generator on-chip).   I'd prefer
the DIP package but I'd even take an SMT that I could stick on an adaptor.

Anybody got a couple in their junk box?

Consolidated Electronics online catalog says they have the MC2831 in stock
(http://www.ceitron.com/semi/semi.phtml?part=MC2831).

Hi,

What is the usual definition of a "vintage radio"? I believe it's 30 years
or older. Am I right?
Thanks in advance for point of views on this.

73,
Sindre, LA6OP

On Ebay, a thing is "Vintage" as soon as you get it home. Witness the
Chinese plastic radios that are "RARE VINTAGE JUST LIKE COLLINS" and
the like.

Vintage is a meaningless term unless you're talking about wine and then
it's price..
Radios don't get better as they age!

In wine, "vintage" refers only to the year in which it was bottled, as
in "vintage 2008."

> Radios don't get better as they age!

Few things do, but people like to collect old things nonetheless.

I would classify a radio as "VINTAGE" if it only has tubes or discrete
transistors.

Hi Ron,
I am in the process of restoring an R109 too,
all the original valves were quite low emission but I managed to get NOS
replacements off eBay.
I replaced all the paper and electrolytic caps and all resistors that had
gone high.
The original vibrator unit and transformer were missing.
I have managed to obtain a vibrator and I will be fitting a suitable
transformer that was designed to fit in the Class D Wavemeter.
I really hate it when people modify equipment - I wish they would leave well
alone!!

FS Excellent Yaesu Model YC-601 Digital Display Unit for the FT-101/277/401/505 series Yaesu radios. The displayed frequency is indicated in MHz, kHz and 100Hz ranges in six digits.This unit is in very nice cosmetic and operational condition. The digits are clear and bright. It comes with the cable to the FT-101E and the original manual. Pictures available. Price is $185 shipped in CONUS. Thanks, Charlie Hugg, K5MBX

Vintage mean obsolete. Or rubbish. Mostly highly overrated.

FS Excellent Yaesu FT-101E HF Transceiver. This is an exceptionally nice Yaesu FT-101E HF Transceiver. It is from an estate and was not used much. It looks near new and still has the plastic on the front panel. There are some small scratches in the trim ring around the front panel, otherwise it is near mint. I brought it up slowly with a variac and cleaned the switches and controls and took each plug in circuit board out and cleaned the contacts. It works great, very sensitive, stable receiver and full output power on each band. It has the Speech Processor. The Original Manual,AC and DC power cords, and the Yasesu Hand Mic are also included. It even has the small plastic bag of fuses, plugs, etc. that came with it new. Price is $325 plus shipping. Pictures available. Thanks, Charlie Hugg, K5MBX

If anyone knows of an online location of this schematic, it would be appreciated. Free or cheap is best. Crumby quality ok. I've already tried BAMA and N.A. Would also appreciate if someone is willing to photocopy it and mail it -- I would pay for your copying and postage.

Thanks

The following message was posted by "Frank" back in 2005:

"I actually have a copy (in pristine condition) of a publication (first edition, first printing, April 1961) by Western Radio Amateur Magazine for conversion of a BC-453 to a complete 40 meter transceiver. It was a design by Ed Marriner, W6BLZ and Ernie Mason, W6IQY."

If anyone has this manual or has any notes, schematics or articles by Ernie Mason, W6IQY (SK), please contact me. I would like to buy them or copy them. Ernie was a lifelong family friend and I am trying to gather all of the information that I can find about the many SSB radios he designed. I have some notes from his estate and two later SSB transceivers that he made. I would also like to hear from anyone who knew him.

Ed Marriner was a prolific writer, and lived within a couple of miles of Ernie and wrote about Ernie's designs. If anyone knows of other articles that Ed did about the SSB radios that Ernie made, I would be very interested to hear about them and get copies if possible. I have a copy of a two page article that Ed wrote in a magazine, that I is referred to as WRA (Western Radio Amateur), about the BC-453 conversion which indicates that Ed had large prints and construction photos available for $3. If anybody bought those prints or photos, I would be interested in buying them or copying them or getting copies of them.

73 -- Dean Billing / WA6IKJ

All,
I'm looking for a six-position band selector switch for my IG-102. If you've got a junker with a good switch, or know where I can find one, please email me directly.

Thank you,
M100C

m100c_at_comcast_dot_net

I have a large selection of rotary switches, quite a few with 6 positions.
How many poles do you need? Does this switch have 2 sets of 6 positions on
each wafer? If so, how many wafters does it have? What does the old switch
measure between the bolts that hold the assembly together?

All,
The switch has two wafers (decks A and B in diagram below), six
positions and rotates 180 degrees.  The Heathkit part number is
63-212.  The diagram gives significant detail as to the functioning of
the switch:

http://www.nostalgickitscentral.com/heath/schematics/heathkit_schema_ig102.=
gif

Thanks again, and happy holidays,

That AR section is a killer, I don't have a wafer with the open circuit
seeking section. But it appears from the schematic that that section is not
used. Is this correct? Are you M1OOC or M100C?

You need to look again. That wafer A, rear section is used to short out the coils for the bands that are not in use. It is a very special switch, and the basic design was used in multiple brands of low end signal generators. I built a couple of those in the '70s, and repaired several others for people who messed them up.

The same type of "open circuit seeking" switch was also used as an input
selector in Hi-Fi preamps and amplifiers.

Well, the OCS switch was used in a lot of places. Every Ledex switch ever
made had one in it to stop the rotation when the selected position was
satisfied.

The schematic I find, is very difficult to read, but importing it into
Photoshop where I can blow it up, I see now that the wafer pins are numbered
to tie to the front section. Sorry M0, I can't help you.

Hey. Notice how everyone in that picture is wearing a tie? The guy on
the left is wearing a bow tie, I thnk? Proper dressing; these days we
are too sloppy; eh? Cheers.

I'd bet most of the Heathkit shop generators used similar switches. I take
it
you can't repair that one? I'd suggest joining the Heathkit group on Yahoo!
It is a very large and very active group.

Try this guy:

Don@D8aPro.com

He's bought the rights to the legacy Heath literature and has
a ton of spare parts from the company. If he doesn't have it,
I'd expect you'll find a parts unit over at the Yahoo! group.

Today I bought an S-20-R which appeared to be in very good condition. However, someone replaced the original speaker. The problem is that the original is a field coil type where the coil is also the power supply filter choke. I can probably find a suitable choke but would prefer, if possible, to find an original speaker. One in working condition is, of course, ideal, but one with a working field coil and matching transformer is acceptable because I can almost certainly get it re-coned locally. Other than that the thing seems to be in good condition and sort of works.

Please respond via personal e-mail. The address below is on a spam-blocker but I will unblock you. I can also be reached through the ARRL forwarder in the usual way (my call @ ARRL.org).

This is an example of total impulse buying:-(

Don Peterson at http://www.d8apro.com/ copyrights for most of the
manuals (some is public domain, but no one knows for sure what is...)
Also has pallets of NOS parts that is being sorted through for the
webpage.

ALL the manuals have been in the public domain for at least 20 years and
freely available.  How can someone buy copyright on something that is
public domain?  Have you seen the prices he is charging?

     Well, as I sometimes do, I yelled for help too soon. A bit of research shows that the later S-40A is nearly identical to the S-20R and later versions of the S-40 are not much different. All use a straight RC filter in the power supply with a 1500 ohm resistor in place of the speaker field (which is also 1500 ohms DC resistance). That is exactly the way this RX is modified so there does not appear to be any advantage in trying to find an original speaker assembly. While I still need to do some detailing on this little guy it seems to work very well and is surprisingly good sounding.

Well, we'd have to know if the manuals were ever copyrighted to
begin with, and if the ones prior to 1962 were renewed.

Proving otherwise would cost a bit, unfortunately.
His prices were lower that most of the other manual dealers.

Not that I like the whole deal myself..

Pete

Exactly where do you get that from? The manuals are still in copyright
and due to the efforts of the Disney Corporation, probably will be for
another 100 years.

The former owner of the copyrights did not stop people from selling photocopies,
or distributing images but that does not affect copyrights. In fact, if the
owner was not aware of the infringment, they can still sue.

All it means is that the new owner can not prosecute people who HAD
permission in the past.

By US law, if they did not have written permission, they can be prosecuted

or sued for copyright infringment. Since the new owner obviously was never
informed of prior infringment, he has four years to sue.

Check with a lawyer how specializes in copyright infringment cases, I
am not a lawyer of any kind.

Geoff.

I did a google on Copyright laws and I understand that copy righted
manuals are protected for the LIFE of the owner plus 75 years..If
Heath decides to sell or sign these rights away ,then Legally we don`t
have much to stand on..In other words, Thanks for all the
"freevies",of the past...now we will have to pay OR bootleg...Wonder

which way it will go???   Harold W4PQW

Hi!

Quick question for the group.

I am looking at getting back into shortwave listening, and am
considering the Yaesu FRG-7 or the Allied SX-190.

What is the recommendation from the group???

I have had and sold several receivers:

Drake SPR-4
Kenwood R-1000
Yaesu FRG-100
Ten-Tec RX-320
Realistic DX-160
Hallicrafters S-38C

TIA

This is true in the UK, not in the US.

In the US, it's around 100 years, going back retroactively to anything that was still under copyright. I think the start date had to do with the first full length Disney film.

Geoff.

I believe for pre 1962 the copyrights had to have been renewed.
All of this was hashed over on the Heathkit Yahoo! users group
for those who want to peruse the subject. The new owner
admitted a few of the manuals weren't copyrighted (AT-1, etc.)
but no definitive list was given. FWIW.

Pete

Actually it was a pretty Mickey Mouse thing. The copyright on Mickey was
expiring so Walt Disney Productions got the law changed.

> The speaker FC must have been a weak link. Mine also had a replacement speaker installed.

You could be right, the S-20R seems to be one of the last receivers Hallicrafters made using a field coil speaker. They were common in the 1930's and 1940's because good permanent magnet materials were just becoming available and were somewhat expensive and it was an economy to use the field coil as a smoothing choke.

I am curious about the mounting method originally used. The advertising states that the speaker was "shock mounted" probably to avoid microphonics, but, since the original mounting is gone, I have no idea of how this was done. Perhaps someone with an intact S-20R or S-22 could have a look.

Another curiousity: The bottom cover has a series of holes for access to the adjustments. Around this are four small holes. It does not appear that anything was ever screwed to these. I wonder if there was once a cover over the holes or if, perhaps, there was just nothing ever there.

Another curiousity, I seem to be full of them: On H receivers the band spread is normally set at zero. On this RX it will go to about 95 but not all the way to 100, is this normal for this thing?

I have to remove the case from mine in order to try to polish the band spread window. Its about the only real blemish on the thing. I've had good luck before in restoring celuloid using toothpaste. Toothpaste is a good polish where you want a _very_ mild abrasive.

Most receivers have their charm. The SX-190 is a beautifully made receiver - but it is limited to certain short wave bands - and it is rather dated. The FRG-7 has always had a good reputation and works well.

It used to be that the downfall of many receivers was drift, frequency readout and selectivity. Most modern receivers have solved those problems - even inexpensive ones. Many of the people haunting this reflector like old tubed boatanchors, and restore them. Sort of like an old car. But, like old cars, they are necessarily better than the new ones. Buying an older radio is an invitation to work on them.

The SPR-4 is a real beauty - but if you want to add new frequencies, you must buy a crystal and they are expensive. Might as well get a synthesized radio that covers all the frequencies you want to listen to without buying more crystals.

Colin K7FM

Thanks to all replied.

Just a brief history.

In the late 50=A1=A6s, I cut my teeth on an old RCA Victrola console radio/
phonograph combination. It had 3 bands:

A =A1V special [police, aircraft, amateur]
B =A1V standard AM
C =A1V SW [9.3 =A1V 15.00]

```
It had a tone and volume control, bandswitch, and that=A1=A6s about all.

I had a 100=A1=A6 longwire strung to a backyard tree.

I would spend hours on the floor with my ears =A1=A5glued=A1=A6 to the spea=
ker
and listen to all the different foreign countries.  I managed to QSL a
large number of them.

Agreed that the digital readout makes DXing easier, but I enjoy
=A1=A5digging=A1=A6 them out [ what=A1=A6s left of them anyway=A1K!  =83=BA=
 ]

Hi,

What's your budget?

Not a boatanchor, but I like the Eton E5 :-)

Cheers!

I would recommend purchasing one of the books that covers radio receivers, such as "Short Wave Receivers Past and Present" by Osterman. Then page through it and decide what features and look you want.

I am just restoring an old Hallicrafters S-40 for a friend. It is one of the simplest short wave receivers, but generally work fine for short wave broadcasts.

Purchasing a short wave radio is like buying a car and is very personal.

Colin K7FM

Given those two choices I'd say the FRG-7 without any hesitation.

Hello,

 I need a single ceramic capacitor, for some work on a VFO. Will send
a SASE and a quarter taped inside.
Anybody have one to spare?

Thanks,

David Goncalves

I don't know the library setup in the UK but here I would look for the magazine in a library's periodical holdings. If you can find the issue you can get a Xerox of the article you want. If you can't find that particular periodical I am pretty sure you can find similar elementary transmittes described in other magazines or books aimed at amateurs or experimenters.

If I recall correctly each calibration manual was part and parcel of the unit as they were hand calibrated and both shared the same serial number. www.fairradio.com has the mtce manual.

Each was hand-calibrated at the factory, and the book matched the unit. Back then, the articles would all say "make sure you get a BC-221 with a calibration book", implying that it would be a terrible task to do it yourself. I have no idea whether that was the case or not, but of course, things were comparatively primitive back then. With a frequency counter, it would be really easy, just repetitive, to build up a calibration book. On the other hand, if you've got a frequency counter, you might as well just us that rather than fuss over a calibration book.

Like everything else, you used to be able to buy blank calibration books at the surplus stores. Sixty years after WWII, I have no idea what kind of stock might remain.

But libraries tend to be more about books that are used, than
an archive. Even if they carried the magazine way back then,
chances are good they are long gone. They need the space for

more recent things.

A radio club is more likely to keep that sort of thing. Maybe
even specifically the RSGB.

Could you explain why the 3B28 and 4B32 xenon-filled rectifiers would need
a series resistance to be added?

These tubes as well as the mercury-vapor rectifiers (like the 866 and 872A) have a relatively constant voltage drop (typically 10 to 15 volts depending on the exact tube). Quite often silicon replacements for these tubes have about the same or even larger voltage drops than do the gas-filled diodes due to the use of many silicon diodes in series to achieve the necessary reverse voltage rating.

High vacuum rectifiers do have a significant forward resistance which depends on the plate current. The classic journal article by O. H. Schade discussing this issue is "Analysis of Rectifier Operation" (Proc. IRE, Vol. 31, No. 7, July 1943). Using the curves generated by Schade (a partial set of which is reprinted in most recent ARRL Handbooks), you can calculate the required resistance to be placed in series with the diodes to replicate the voltage drop of the 5U4 originally used.

In case anyone is wondering about the heat dissipated by this series resistance, it is essentially identical to the heat generated as plate dissipation by the rectifier tube. However, the filament heat is no longer produced. Since transformers are one of the most expensive items in a radio to replace, this savings of filament current is beneficial.

Actually, that's a very good question. In addition to providing a fwd resistance more or less equal to the hard tube, the resistor provides a safety valve, so to speak, to prevent a true, dead short that these rectifiers could present. This is in addition to normal circuit protections, of course.

I am looking to add an additional bulb and bracket to the rear of the
s-meter of my HQ-145XC, in order to light the s-meter. Is this an east
addition? i.e. just sodering the bulb wires into the exsisting chassis
point?

73

?John

Who would have a bracket of some short?

John, I've scrapped a few junker HQ's and probably have the bracket you need. My '145 does not have the flip up top so I can't see which type you need. Is the one with the squeeze-together side tabs or is it the type that slides over a tab? I also have the kind that screws down to a flat surface as in the HQ-120.

Regards de K3HVG

You can make your own one with the socket from a bad tube, two 1N4007s,
and a power resistor.

Stripping is a big deal with some big power tubes... I have never seen it
be a problem with small signal tubes and any receiving tubes that are
rated for series-string operation will not have any issue.

I have for sale a brand new Telex Hy-Gain T-2X (Tailtwister) rotor. It comes complete in the original box and has never been used. The rotator has never been out of the box except when I took it out to test it. It is the older version without the plugs for the control cable. It has the original manual and accessory packet and it comes with approximately 50 feet of new rotor cable. It lists new for $799.95, and I'll take $475 plus shipping for it and the cable. See more specs at the Hy-Gain website at:
http://www.hy-gain.com/Catergories.php?sec=8 Thanks, Charlie Hugg, K5MBX

Ron,

If you contact the editor, Ron Mannion G3XFD, he may well have the edition and be willing to supply a copy. His email address is rob at pwpublishing.co.uk

Charlie.

The tube replacement always seemed like a good idea to me, so back in the good old days, I did just exactly what many responders here talk about.

I replaced the 5Y3 (I think) in my RME 4350 with a resistor and a couple of nondescript silicon diodes (before the advent of the extremely 1N4007), and after fidgeting with the voltage output by adjusting the series resistor, found a new hash on the received signal.

It's been a while, now, more than 40 years, but if I remember correctly, I tried RF chokes, additional filter capacity, smaller ceramic disk capacitors (condenser, actually, but what the heck) and I finally went back to the original 5Y3 tube.

As I remember (and probably have the scars to prove it) the voltage dropping resistor got pretty hot.... had to use a wirewound resistor to handle the heat.

Old Chief Lynn, W7LTQ

Hi Guys
Thanks for all the suggestions, seems odd that there is no old PW
listing
as it is/was a very popular magazine, the PW was taken over a few
years
back and any enquiries I've made in the past to the new owners usually
only relate back to the take over year, but it may be worth another
try
perhaps they may have some more info now.
cheers from Ron g3yuh...

Hi guys, I need some advise on an old British R109 receiver I'm trying to get going, I bought it recently, and it has been modified, the mod was to replace all the octal valves with small B7G valves, it has been done very well each valve has its own adapter, however the detector pre amp valve was originally an AR8 which is a triode plus two diode and this has been replaced with a 6AM6 which is a straight RF Pentode!!! first of all I thought the wrong valve had been used BUT it seems to have been wired up as a triode, screen grid and anode strapped together, and the suppresor grid used as a detector diode? would this work? as I'm having trouble in this area of the set, I suppose I could replace the 6AM6 with a DH77 and rewire it as that more closely resembles an AR8 electrically, but don't want to go to all that trouble if the suppressor idea should work and the fault is elsewhere.
comments welcome
from Ron...

Strapping a pentode into triode mode is very common when you need something with particular characteristics and can't find it.

The question is what the two diodes on the AR8 were used for. If they weren't used at all, you'd be home free. If one of them was used as a detector and the cathode tied to the cathode, using the suppressor grid might work, but it might also be noisy. I'd tend to disconnect the suppressor and use an external silicon diode.

I don't suppose you could find an AR8 somewhere? If not, I'd first try a silicon diode just for test purposes.

Oh yes, and what about using a 6AV6?  Two diodes, and a triode with plenty
of gain.  It's got 2 pF grid to plate which is annoying, but you can do worse.

Thanks for the help guys, I now have the set receiving well, the fault
turned out to be something entirely different, but I can say the
suppressor grid of an EF91 works well as a detector, with the tube
wired as a triode, a little noisy as the gentleman said, so the guy
that modified it knew his stuff!!
Anyway thanks again, nice to know there are still glowbug enthusiasts
out there :)

Yes, that is a problem with the silicon diodes.
If it is a problem in any of the rectifier tube replacemnts, one can
connect  series connected .001u and about 33 ohms across each diode.
The .001 should be rated for 3kV. keep the overall length of the R-C
and leads to less than 1 inch.

Neil S.

Well, that might have well worked! Didn't try that, I guess.
Isn't that something like what Decca in some radar pulse
circuits called a "tail biter"?

I have a meter for the Heathkit SWR bridge. It ,measures 2" across
the top, 1-5/8" top to bottom and 1-1/2" across the bottom. Asking
$10.00 plus postage.

If interested please reply by e-mail

I have a BC-458 transmitter I would like to sell.
It also goes by ARC-5 transmitter,Command Set Transmitter and SCR-274-
N
This was used in WW-II aircraft
This set is untested so is being sold As-Is
It is all there(tubes,etc...)and is in great shape but does have
normal wear for its age.

If you would like pictures email me and I will send some

I'm asking $80 for it but will take reasonable offers
Plus Shipping

Thank You

At the risk of possibly appearing to be troll, which is not the case, I
have an R-392 that is not part of the regular line of these receivers.

It was mfg by Colling for the Navy/Marine Corps. All is identical
except that the normally supplied hex-head cap screws for the
chassis/case are, instead, like the large, old-family GRC/VRC type
thumb-screws. The contract number is clearly Navy. The S/N is below
10. I have 4 R-392's, two of which are installed with GRC-19B setups
and may well divest the other two next summer. Is there an genuine and
overriding reason to keep the Navy/USMC unit? Note that all are in very
good condition?
I'll appreciate any comments.

SD1726 is a current production part from ST Microelectronics.  According
to ST's website, Digi-Key has stock on the things and should sell onesie-
twosie.

It's the package that makes it expensive.  I'm not sure why they even
went with the fancy stud mount with something with so low an Ft.

In an old-style valve (tube) communications receiver circuit which utilises
two I.F. stages and uses three I.F. transformers, can someone explain why
the last I.F. transformer (which feeds the diode detector stage) need to
differ in some way to the other two?
Any help would be greatly appreciated.

Theo

Thanks Hank,
Does this mean that the windings of this third I.F. transformer need to be different in some way than the previous two, and if so, by how much?

Theo
The secondary of the IF xfmrm feeding the diode will have a different
winding than the first two. My transformer theory is not up to snuff,
I'm 68 and if I recall correctly a diode has a much lower input
impedance that has to be matched so I'm guessing it will have less
turns. Remember that a transformer reflects the impedance back.
You may want to get a copy of The Radiotron Designers Handbook by
Langford, it covers just about anything you would want to know about
tube radios, over 1000 pages.

The over 1000-page one is the Fourth Edition, which is the most expensive
on the used market, and the one which has the most hi-fi information in
it.

The discussion of IF strip design is also in the smaller and much less
expensive Third Edition. Some people like the third edition because it
has some information on transformer design which was not carried into
the fourth.

A copy of the fourth edition is available online here:

It would certainly help to see the schematic before jumping to conclusions.
There are many designs out there between American 5 and FT1000D, and you
don't specify.

Over the years I've gone thru several 4th editions but have never seen
any of its predecessors. I'll have to watchout for some.

Hey JB
I assumed since the query was in this group it wouldn't be a FT-1000 and
not  an AA5 because it has only one IF.  It would be nice to know what
radio but anxious people making queries and get carried away and I'm
one..

I see the second and third editions at hamfests a lot. They are often
black and less than half the width of the 4th edition so you might not
see it unless you're looking for it.

The forth edition is available in PDF form from Pete Milette's site:
http://www.pmillett.com/

Along with many other classic books including K.R.Sturley's two volume book on radio receiver design. The organization of the site is a bit confusing so a bit of poking around in needed to find everything. The quality of his scans is excellent but the files are _very_ large and really require a high speed connection to be practical.

I also recommend the 4th edition of the Radiotron, I think I have two, the one I bought new fell apart from use (rebound it). The 3rd edition, which is much smaller, also has a lot of useful information in it.

I agree with the statements made about the final IF transformer but not all detectors offer low impedance to the transformer although this is true of straight diode detectors. Both of the above books have thorough discussions of AM detectors and their relative merits.

Related to your other comment, I think that the one on the E-place has
been repainted.

My yellow striper came with the decades-old Dymo stickers still
attached. I swear the glues in modern Dymo labels aren't as good.

Tim.

K9YA Field Day Results

The K9YA Telegraph is a free, monthly, general interest amateur radio publication read by ham radio operators in more than 100 countries. The K9YA Telegraph contains the stories and features most wanted by our readers, because it is written by them. An e-Zine, it is delivered monthly as a full-color PDF file.

If you're in the mood for Morse, hankering for history, gluttonous for gear, ravished for a review, needing nostalgia, or just plain famished for fun, you'll find it in the K9YA Telegraph.

To download sample issues, subscribe or write an article, visit the K9YA Telegraph Web site. http://www.k9ya.org

But the P-touch makes suitable substitutes that look great and adhere
very well.

The majority of my crystals were reground into the amateur bands and
more than a few were moved several hundred kcs. My preferred coarse
abrasive is valve grinding compound, specifically Permatex 34A. Once
in the ballpark Roger's Silver Polish or Dremel Polishing Compound is
used to get close. Scouring powder is used for fine-tuning.

Can someout please give me the pinout for the black Collins "bathtub"
IF filters used in various boaranchor receivers? They have two groups
of three pins on each end of the filter. One is marked with a ground
symbol, but what about the other two?

I've found several excellent web pages that deal with identifying the
filter characteristics from the part number, but I have yet to find
any pinout information. Curious...

Thank you.

73,
Jeff

The two outside pins, at the outside edges, are for the input and
output. The black bakelite S-Line style filters require a
resonating capacitor. You should be able to see coil resistance
between either outside pair.

Pete

The transformer and choke? have a 'National' look to them??????
Anybody agree?
An 80 rectifier suggests late 1930s?

Looking for the above ARC aircraft units. Have a few nice T-25C's to
trade. Thanks...

Does anyone know without ANY doubt whether the SR-500 and the SR-160 are EXACTLY the same radio, apart from the final tubes and the plate supply voltage?

Thanks and 73

I Tony,according to the Hallicrafter data that I have ,Says there are
differences in Receiver also..SR 160 is dual conversion and SR 500 is
single conversion..Not much data on either.. 73 Harold W4PQW

Can anyone recommend a source for boatanchor (Hallicrafter and Collins)
rebuilds/repair in the Dallas Fort Worth area?

Thanks

Tony

I'm selling a friend's BlackCat 1000W HF Linear Model JB2000/10-80 (3-500Z Tubes) that was manufactured in or near 1976. Unit is strapped for 120v operation.

Some pics -> http://www.vambo.org/pictures/BlackCat/

I've recaped the unit with higher quality electrolytics and replaced the HV diode stack with diodes of higher voltage and current ratings. I've also installed a 20ma relay keying circuit in place of the automatic power detection circuit. The tubes are the original and *may* need replacing but it still was able to produce over 400watts of AM power with acceptable harmonics. One of the tubes looks gassy when under load and was removed.

I'm not going to try and tell you this is not a POS but it is a working linear that has been rebuilt that has some life left. It's a great way to put yourself into a linear cheaply. I will not ship this unit but I am willing to help deliver on the front range of Colorado or part way for the surrounding area. $200

So?

It's a multi-band amplifier.  In order to tune the full width
of the lower bands, the variable capacitor(s) have to vary enough
that at 10meters they will tune more than the 10meter band.  It
doesn't need an 11meter band position.

What you need to look at is what other information was provided.
Like is it a known ham manufacturer?  It's not.  That's the giveaway.

FT101 by yaesu has a 11m band switch yet it's not illegal nor have I
heard of the FCC busting hams who own them. Wawasee Electronics built
allot of ham gear in it's time so under your definition, it's name brand
defines it's legitimacy.

Being that this amp is also listed in qrz, the seller is obviously a ham.

The guy has a legit piece of ham gear even if it were *explicitly*
capable of 11m operation. The question is if nospam would sell it to a
non-ham against FCC 97-317.

Hi All;
Neat receiver but the meter is bad, seems common for these radios.
I understand that meter for the Yaesu FLDX-400 fits but face place
needs to be exchanged.
Any ideas?
73......

Rich, how does the receiver compare, say to a Drake 2B?
It is an interesting set.

Pete

Well Pete, It just started to play after what looks 30 years in the
attic.
So far I have only cleaned up the chassis, removed tubes & cleaned
sockets, switches & pots.
I was surprised that the more I did, the better it played.
The meter is bad but with only a 10' piece of wire & can here stuff on
the poor bands that we have at present.
At first, audio was a bit garbled but that seems to have worked in,
maybe most of caps finally charged up:-)
My first impressions is the 1KC readout is nice/better then the 2B but
I think the 2B is better, how much, dunno yet?
I know it is not as good as my Drake 1A.
I bet if it was completely restored electronically, it would be a nice
receiver. I don't have that skill though.
Try doing a search, a few JA's have pics or thier restored SR-600.
73......

Hi Guys this is a real longshot, I'm looking for an article that was
in a Practical Wireless Mag about mid/early 1950's  It was on a two
valve transmitter, it was unusual as the chassis and front panel were
made of hardboard!! I owe a lot to that article and would like to
build it, I kept that PW for years but it finally got lost in one of
my many moves, I would really appreciate a scan of it if it could be
found, cheers from Ron g3yuh...

ron,

Sorry I can not help you out on the article and not knowing exactly why you want the article, but perhaps an old ARRL Amateur Radio Handbook of appropriate year, may get you close.

Paul P.

Is this Not a CB radio? Does it belong in Amateur.boatanchors? maybe
it should be listed in CB radio section..MH

Maybe he meant HXL-1 and just flubbed on the title?

I have a fairly nice H/W T-90 Bandmaster transmitter up for sale or
perhaps trade inasmuch as I don't hold and hope of finding the companion
receiver.  There is no power supply to go with this one, however. I do
have a copy of the book.  The xtal door and adaptor are there and I'll
include the requisite Cinch 12-pin power connector.  The antenna relay
and receiver connector are installed, as I understand in some variants,
they were not. $250 (offers) plus shipping from the MD/DC area.

Is there a soild state replacement for the rectifier tube 5U4 in a
HQ-145xc?

Seems I remember such a tube being available for around $20 from an
internet source.

Its easy to make a substitute using a couple of high voltage diodes from Radio Shack and a series resistor to get the voltage back down. I am not sure of the size of the resistor but think around 50 ohms, someone here may have a better value. Nearly any vacuum tube rectifier can be replaced with this arrangement. The only disadvantage is that the B+ is applied right away whereas with a tube rectifier the voltage does not appear until the filiment has warmed up a little. That gives the other filiments a chance to come up to temperature. Not a big deal.

Many, if not most, of the smaller (read: 5Y3, 5U4, 5V4, etc.)SS replacements do not have a dropping resistor molded inside the unit. I/we use a series of SS replacements up to and including the 3B28 and 4B32. The latter two SS replacements do have the resistors owing to FAA purchase specs, however. Just be sure and include resistors in your replacement design. As far as filament "stripping", as alluded to by another posting, some say its a big deal. If the unit is not being turned on and off many times a day, every day, I can't see it being a problem.

The simplest thing to do is get an old octal tube base and solder in two 1N4007's. If it pleases you, fill it up with some Home Depot epoxy or the like, just like the commercial jobs. Remember to hook the diode outputs up to the correct DC output filament pin, as the Hammarlund schematic indicats. Leave the other pin vacant, of course. While your at it, try and keep the a.c. input voltage down to where the mfgr says it should be, or a few volts less. High line voltage can really add to the spectre of failures of vintage equipment

Later models of the HQ-145 had hard wired diodes in place of the 5U4
family. I found that out when I had bought a schematic and found some
discrepancies between what my HQ-145 had and the schematic. Then I
happened to find on the web a schematic that had the 5U4 in it, so
this was undoubtedly an evolutionary change in the production runs.

My schematic doesn't specify what diode was used and I'll have to
check to see if a dropping resistor was added. All my schematic gives
is a Hammarlund part number. Of course, with no Hammarlund Radio Co.
that is now meaningless. But I agree that garden variety high voltage
diodes would work. This certainly would cut down on heat in the radio
as the 5U4 is the biggest tube in it.

Hank,

That looks like it is from a Collins 310B which is a 40W (input) transmitter. But if so, it is missing the pointer for the lower dial. From the part number on the side of the PTO, it is a type 70E-8A which was used in the 310B and I think the 32V-x transmitters as well.

73,
Bob AD3K

I recently bought an HRO-Senior with a power supply that does not match that receiver type.

It probably is the companion of a more recent HRO version, or of another receiver though probably still National.

Can anybody help me to identify it? It can be seen at http://www.qsl.net/i0jx/power_supply.jpg The Rectifier tube is type 80.

Thanks & 73

I believe it is a homebuilt power supply. and A very nice looking one..As I recall ,the old doghouse supply was difficult to work on, created a bit of heat and was probably not one of Nationals better designs. If it works good use it and appreciate it.I say..W4PQW

Hank,

I'm not sure how many models of the 32V-x transmitters use that PTO. I would expect the 32V-1, but I don't know if the 32V-2 and/or 32V-3 use it. You may be able to find that information at the Collins Collectors Association web site.

73,
Bob AD3K

If you can find one of the original military test frequency crystals for
3885, that's fine.  If not, I can recommend MH Crystals in Rancho
Cucamonga, CA.  I've tried some of those miniature xtals stuffed inside
FT-243's and found that some kind of work, others don't.  Also, its
almost impossible to use oscillator keying when you use them as they
whoop and stumble into oscillation (IF they oscillate, at all). MH uses
a large blank crystal in an HC-6 holder with FT-243 pins.  I use them in
the BC-669, etc. which have high crystal current.  They do just fine.
The cost is about $14 each.  Just ask for the standard FT-243 spec with
32pf capacitance.

Or, grind your own. Simple and rewarding. Find an old novice crystal and start grinding. Any of the old Handbooks will give you all the information you need.

I have used sandpaper and had good results, when nothing better is handy.

You can also etch with chemicals - same stuff that is used to etch glass.

Always better to roll your own.

73, Colin K7FM

Yesterday I got an e-mail back from my query and they did send a .pdf file
of an advertising sheet with the schematic.
There is enough information here that I believe someone could put this kit
together and make it work.
It uses a 6BQ7A in a cascode RF amplifier with a 6U8 oscillator/ mixer. The
poop sheet claims
0.5 microvolt sensitivity. This particular converter has an output of 7-11
Mhz.

Somebody with knowledge of VHF and a good set of hands could have a lot of
fun with this.

By the 1980's, Nuvistor tubes (6CW4, etc) had pretty well become the
standard for 2m RF amps and converters.
The info from ICM shows a retail price of $12.95 for the kit, so I rather
believe it is from the
late 1960's or early 1970's.

I would still like to find the complete original construction information
for this FCV-2 converter kit.

The Nuvistors were history before the 80s. Ameco converters were
using them in the 60s.

And to be honest, some of the frame grid tubes were almost as good.  I had
a converter built from a TV tuner with a 5X8 that was really quite marvelous
on 2M.

Has anyone seen any of the compactron TV tuners?  I remember hearing good
things about them at the time.

I want to do some experimenting with vacuum tubes. I can remember being fascinated by them when I was a kid. As I got older I became interested in solid state electronics, turning my back on tubes. I find that the older books are easier to understand and seem to fill in some of the gaps that newer books leave out. Most of the circuits in the old books are based on vacuum tubes. Right now I am interested in really understanding how oscillators work. I want to begin with the Armstrong oscillator. Consider the circuit at:

http://www.electronixandmore.com/articles/oscillators.html

I get the basic idea about the tank circuit creating a decaying sine wave at a frequency determined by L and C and the tickler coil kicking in at just the right time (I am assuming at the positive peaks of the sine wave?) kind of like pushing a kid on a swing.

I don't understand the how the grid resistor and grid capacitor work.
I am having trouble understanding the statements:

"The grid resistor drops the voltage, thus the grid is very negative with respect to the cathode. The grid capacitor keeps enough charge to keep the grid negative for at least one cycle of oscillation, it helps keep the grid negative when either side of the LC circuit is positive.
"

I need some more explanation. I understand that the triode is passing
the most current when Vg = 0 and passing less and less current when Vg
goes more negative.

Any help would be greatly appreciated. Thanks

No, it's most likely late fifties, or very early sixties, since shortly into the sixties Nuvistors became king for converters (unless you had a 417 or better 416, or a parametric amplifier). By the later sixties JFETs were taking over, they were in converter construction articles about 1965, followed shortly afterwards by Mosfets, which came around about the time they realized how to use bipolar transistors properly for receiving.

Checking old magazines would offer up a date, and I decided to do that. The ICM ad in the December 1958 issue of "CQ" shows it among other of their small kits. I had thought the model was descriptive of the band it was supposed to tune (so it would be for 2 metres and an FCV-6 would be for 6 metres) but apparently it came for both bands, "model 50" for six and "model 144" for two. The ad shows the price as $12.95 without tubes, $17.95 with tubes.

It doesn't say, but a lot of their kits were flexible, so you could specify the output frequency (within reason), they'd designed the kits to accomodate some level of change by the subsitution of a coil or two (and of course the crystal).

It's the sort of thing that would have gotten a review somewhere, but I'm not looking and I don't have a complete collection of back issues. At least you know the era now.

It was likely a fairly standard converter for the time. Even when Nuvistors came along, they were sometimes just used as a low noise rf stage ahead of a 6U8 mixer/oscillator stage.

Oscillators are the same whether vacuum tube or solid
state, however, if you are interested in vacuum tube
circuits it will be helpful to have some books written when
they were the ones being used. There are several classic
books on electronics at Pete Millett'
s site at http://www.pmillett.com/ ranging from quite
elementary to advanced engineering and theory books. See
http://www.pmillett.com/technical_books_online.htm

Also, the old RCA tube manuals had a very good section
on vacuum tube fundamentals, very much worth reading. This
section did not change much over the years so almost any
edition will do. I think there are a couple on the above

site.
Note that Pete's files are very high quality and VERY large. If you are on a high speed connection this is no problem but don't try it on a dial-up:-)

I bought a Motorola dc/rf aligment meter type TEK 7A, but I can't find a manual.
Can someone scan this manual?

Robert PD4GLR

```

This R-392 wannabe followed me home from a swap meet. It seems to
work, but the FSK Module is missing. Anyone have a junker I can
plunder ??

Thanks, Dick, W1KSZ

FS: Astron RS-20A Power Supply. This is a big, heavy unit that puts out
good, clean power and doesn't get hot. Rated 16 Amp continuous, 20 Amps ICS.
This power supply is in good shape, electrically and looks decent as well.
The cabinet has been repainted a flat black. I am asking $45 plus shipping
from zip
79602. Pictures available. Thanks,
Charlie Hugg, K5MBX

```

do you have a GARDNER - BENDER (G-B) VOM model GMT - 19P ??

i need the resistance of R - 6 .

for an internal view of the unit go to   www dot freewebs dot com /
waltbelsito

click on photo gallery ,   click on multimeter , click on internal
view , for larger pix .

the resistor is actually marked R-6 on the board .

i need either the resistance or color code .

thanks WALT

If r - 6 is a range scaler you should be able to calculate what it's
value is by measuring the range resistors for other ranges.

I'm looking for a nice, working PSM-6 multimeter. This was the meter I
used for a few years as an AF avionics tech in the early 60's. I'll buy
outright or trade someone a like condition Simpson 260, as I have
several of them, all in nice condition. The PSM-6 must have the cover
but if no special battery or probes, that's no problem.

I've got what I believe to be a NOS replacement meter for the PSM-6
dated 5/76 made by Bruno, still in what might be its original shelf worn
bag. It has the zero-set on the back. If you find one with a bad meter
let me I as would trade this for a 2 1/2 inch 25 microamp meter I need

```
for a Lavoie WWV Rx.

I second K3HVG's assessment. MH is excellent.

Also, don't rule out grinding your own. I tried it as a novice in the 60s and it never worked. Last winter I started playing around again with some old FT-243s. Put a few drops of water on a piece of 0000 grit emery or sandpaper laying on top of the glass from an old picture frame and, voila, it actually worked! I've reground about 7 crystals successfully now. Very satisfying. But be sure to use the technique described in an older publication like Bill Orr's Radio Handbook or even one of the EARLY Newington books.

Good luck.

I just finished the somewhat pricey book "Crystal Clear", a tome about the crystal industry and the Signal Corps in WWII. Its incredibly interesting and illuminating. I now know why I had a difficult time with home-brew crystal grinding! The thing is, I recently have seen write-ups about the same subject, with recommendations and methods wholly debunked by Army and crystal industry way back in 1943. Too bad this book is so expensive. I'll have to check out Orr's handbook and see what he said. I have a couple of DC-35's to bring up a bit....
Where is Leo Meyerson when you need him? (Hi!!!)

OK, here's the info:

Crystal freq for Bands 1, 2, and 3 = signal frequency + 455 kHz.
Crystal freq for Bands 4 and 5 = signal frequency � 3035

Specification: Type CR-18 (HC-6), fundamental mode, 32pf circuit capacitance, ambient temp.

I suggest: MH Crystals, Rancho Cucamonga, CA
They charge about $14 each and are very reliable folks.

Good fortune!

de Jeep/K3HVG

I don't think there was an obvious rationale behind some Hallicrafters
tube lineup choices.

The SX-110 was introduced in 1959 and made through the 60's, but was
using metal octal tubes - reminiscent of the 1930's - when the rest of
the world (and other Hallicrafters models) had switched to miniatures.

Tim.

Wow, that brings back memories. That is a receiver which came into being right around when I did (1950's).

The tubes in it alone worth something (can be hard to get replacements these days, just price them!)

I sat before one of those for untold hours in my younger days ... shame SW is so empty these days ... :-(It was an EXCELLENT RECEIVER ...

Regards,
JS

A very common modification, especially by the Navy, was to add a jack
there to monitor the diode load voltage, this makes their regular
maintenance much much easier. NAVSHIPS-0967-063-2140 documents this.

Isn't there a Diode Load terminal on the back already?

BTW: That paint job looks awful. Too shiny. I had 2 of those beasts
and liked a slightly worn look a lot better.

They aren't that difficult to tweak to superior performance. I
wouldn't spend more than $500 for one with a good RF deck.

The NAVSHIPS document states that a Dymo label should be affixed by the
jack.

hi scott,
     i received the twinax today...tnx much..was correct connector for
the audio..i found a source for the triax male 3 lug w cable that i
need for ant conn.  now all i have to do is to make a homongo loop for
ant.  tnx agn for the stuff, i really appreciate it.  by the way, i
got a real kick out of the name of ur co.
    73, pete

Well, an ancient RCA tube handbook does list the 45 as being for AC operated sets. It needs a center tapped filiment transformer for cathode return although it could be done with a center tapped resistor across the filiment. The 45 (AKA RCA UV-245) was an old and obsolete design when the Super Pro was designed. Why do you think this tube is superior to trioded connected 6F6's?

Hello and thanks for taking the time to read this.
I am a new Amateur Operator licenced now just 2 years.
One of my project's is restoring a old single tube rca 117-n7 cw
transmitter.
I have managed to come up with my own schematic of the radio but would
like to compare it to the original schematic.
I believe it is from "Ham Radio Projects" 1968 by Bert Simon Page 105.
What i am "asking" is if any-one has this OLD book and can
scan/photocopy the page/article for me ! I have checked with my local
library's and this book is no longer in print and so far i have been
unable to get a copy of it.

Thank you again for taking the time to read this.

Richard
I don't know if the 45 triode is superior to a triode connected 6F6, I
was just wondering out loud at the keyboard. I know that audio
aficinianodos like 45s in class A but this is PP, B. It was a thought
that shouldn'thave made it to the keyboard, hi hi..
I took the beast to the hamfest but only found lookers and knob
twisters. Now I have the back breaking chore of bringing back to the
bench and checking the audio PP xfmr.

I just recalled I have a GR 583-A Output Power Meter wasting gravity and
if it still works I'll have the answer.  If you Google it, you'll see
the one Sphere has for sale.  Thanks for all the comments.

That will definitely give you the output impedance but be careful not to overload it. There is something odd about this. My BC-779 is in storage so I can't make resistance measurements on the transformer. I think its time to dig it out though.

I am afraid many people simply don't know what the Super-Pro is or how good they are.

What part of the world are you in?

Hi James,

I was going to suggest checking used book dealers. At least two copies of the book are available, but the booksellers must think the book is for glass audio sudiophools. The prices are $97.95 and $120 respectively! [Prairie Wind, Eldora, IA and Bank of Books, Ventura, CA] IMHO, these prices are ridiculous.

For only a few pages, I suggest contacting the Library of Congress. Their call number is TK9956 .S525. The listed full title is "104 ham radio projects for novice & technician". You can contact the LOC directly or you can go through your local library.

I have one final word of warning... In direct line-powered circuits such as these, you need to be extra careful with your construction and with use. New hams are to be encouraged, not fried! ;-)

Yie, yie yie!
From olden days, it always excites me to see the key, a good ground,
and a 117vac plug
connected so intimately!
Many years ago I started collecting stuff to make something like you
have in your hands, but
fear and common sense always made me chicken out.
I Googled for a while, and the following is the closest I could find,
and it isn't
even a 117N7, but a 50C5 with a heater series resistor.

http://www.kb7tbt.com/manuals/Ham%20Help%20Manuals/
Electronics%20Illustrated%2010%20Basic%20Designs.pdf

Sit on a dry wooden chair, with your feet off the ground, and one hand
in your pocket.

Good luck,
Old Chief Lynn, W7LTQ

Mine's in the trunk from the last hamfest with the power supply
connected so I have to carry both at once, the ps on top.
I'll get to it tomorrow, too many other things today..
I'm in Tulsa, OK

CONSIDER:

Using a bench top isolation transformer.

-Or-

http://www.mif.pg.gda.pl/homepages/frank/sheets/049/1/117N7GT.pdf

I can add up about 15 watts of plate dissipation and filament wattage. Perhaps an isolation transformer may be in line here. Use two similar wall warts of about 30 to 40 watts min. Same voltage secondary.

Connect the AC section of the secondary (before the rectifier and capacitor with in a DC wall wart) together and you have an isolation transformer for that single tube project. If you choose 6 or 12 volt secondary you also have a future filament supply for other projects.

You may have to establish a ground for this circuit when using an isolation transformer.

A bit of safety does not hurt,

Paul P.

I'd suspect that should have been an AM transmitter. Any ideas
on how they modulated it?

Pete

Thank you to all for the help and suggestions.
I have my Schematic if any-one would like to have a look and maybe
suggest some thoughts.
I have still to actually fire this thing up. I got it at a local flea
market a year ago and was told it works, and i trust the person i got it
from. Plan to do some comparision witht the original diagram and will
disassemble the project and clean/replace any parts with modern
replacements. I also DO plan to build/buy an Isolation Transformer as
well as a Variable PowerSupply.

Thanks again for your thoughts and info's

I suspect it's grid modulated since there's no big modulation
transformer.

It's November and time once again for the Hampden County Radio Assn. annual auction. Admission is free for both buyers and sellers. This auction attracts an attendance of around 100 people year in and year out so don't miss it.

HCRA Annual Auction
November 7th
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

Set-up starts at 6:30 PM
Auction starts at 7:00 PM

10% of the selling price (up to a maximum of $10) goes to HCRA, the rest is yours!

Please mark your items with name, call (if you have one) and a minimum bid. We do the rest.

Too embarrassed to put your name on some of the stuff. Why not donate it? We're not proud, we'll take anything!

A few simple rules:

Please mark your items clearly.
Please, no computer monitors or printers, they just don't sell.
If it doesn't sell you take it home (we can't dispose of things).

Bad economy or not the Giant Raffle returns again this year. For as little as a $5 donation you could win a $250 gift certificate to HRO! Tickets are on sale now and will be available at the auction.

Additional information is on our web site at: http://www.hcra.org or contact:

Jim Mullen, KK1W
144 Tower Hill Road
Brimfield, MA 01010
413-237-4666

kk1w@charter.net

See you there!

Lynn,

I built one of those, too!  I was able to light a 25W "dummy antenna
wattmeter" to nearly full brightness... for a few seconds.  If I held the
key down too long, the toob envelope would get too hot, and fracture.  That
wasn't a problem, as I had many 50C5 pulls from old table radios!  It was
important to make sure the B- of the supply was common to the AC supply
neutral, and to not get your fingers across the key contacts! :-O

vy 73 es gud dx,
Bryan WA7PRC

Hello and thanks for the read. I have an ERC (Electronic Research Co.)
Oven-Crystal in an 8 pin octal base can.
Does anyone has a lead to a site where I could find which pins are for the
115V AC heater, +V and it's ground and at what voltage range to make the
1MHz xtal oscillate, and which pin for it's output.
I am trying to adapt this unit to fit inside a Motorola R-1201A signal
generator that is missing the original Xtal unit.
```

Thanks for any help.
Larry McGee

I received an HA-350 that had been dropped on it's preselector knob. The capacitor is broken. Opening the radio and moving it to the unmeshed position (7 mHz) shows that the radio does work, quite well in fact. However it can not receive anything on any other bands.

I have the manual, but it does not give any description of the capacitor.

Anyone have any specs besides it's a dual air variable? My guess is that it's a 365uuf capacitor as they were common items when the radio was made.

Anyone have one to spare they would be willing to donate to restoring the radio, or a source for them?

Thanks,

Geoff.

An ohmmeter and a bridge will tell you what you need to know.  The two
pins that have DC resistance between them are for the heater.  You should
know that not all of these have 115VAC coils, a lot of them have lower
voltage DC ones.

The two pins that go to the crystal will have a higher capacitance between
them than the other pins, which the capacitance tester function the DMM
will tell you.  If you have a real bridge, you should be able to sweep back
and forth and see an impedance dip at 1 MHz.

DC on heaters is good!  It will reduce the amount of 60 Hz jitter.

I remember a book like this published by Tab Books.... but I don't recall
anything using the 117V filament tubes, I remember a design instead using
a TV sweep tube for about 10W of hot chassis goodness.

I also remember a design for a 2M converter using a compactron tube, which
I built and which was really a good performer.

Is this the same book? I also recall it as being remarkably free of typos
for a Tab publication.

I'd guess it would be around 100pF, or less, per section. The maximum
it has to tune is the 500 kHz spread for the 80 meter band.

Pete

Thank's, I found several copies of the manual of different quality
and scanning technique. They all contain a schematic with no value listed
for the capacitor and do not include a parts list. :-(

Geoff.

Is this a complete crystal oscillator or simply an oven-ized plug-in
crystal unit? If its a simply oven/crystal unit, there won't be any Vcc
voltage. Try and open the can, remove the crystal, then map the xtal
socket pins to the octal plug. Some of their ovens are dual-voltage
(e.g. 6v and 12v DC). You also may be able to actually see the oven
windings going to the socket.

Does anyone have a manual for this General Radio Output Power Meter pdf
or paper.

IET is putting all the old Genrad manuals up. They have a list at:
http://www.ietlabs.com/pdf/Manuals/index.html right now.

It doesn't include the 583-A, but send them an email and let them know
you'd like to see that one.

No response to my query about two weeks ago so I am trying once more. I am looking for a Drake AC4 power supply but will take an AC3. I don't need the cabinet/loudspeaker although it would be nice to have. If possible I would like to find one within driving distance of Los Angeles but I am not insisting on that since they seem harder to find than I thought they would be.

Contact me off list please. You will get a spam blocker message but I will either see the message and unblock it or send the spam blocker message back.

Hello to all,

I'm trying to repair a Systron Donner Spectrum Analyzer, model SD764.

It is the military version (I think) and it's working with some difficulty and measuring errors.

Anyone know where to find a service manual, even willing to pay for ???

I'm also trying to find the ENGLISH manual of Rohde&Schwarz *ZWA* Wobbler . It is an ancient Vector Analyzer (1968 vintage).

I do have original GERMAN manuals, but my knoledge of this language is nil !!! :-(

Seems fully functional, but... without understandable instructions I'm lost .

You can reply also directly, my mail is valid.

Thanks for any help furnished, cheers de I5SPO, Piero.

Hi, Gang

Books.google.com has been expanding their non-fiction coverage.

If you search for "electrical" and then choose the "show full view only"
category, some neat books emerge. I've been browsing works
by Oliver Heaviside and Nicola Tesla.

It's also nice to have "Methods of Measuring Electrical Resistance"
by Northrup (of Leeds and Northrup fame).

The books can be read on line, or the pdf files can be downloaded
and printed.

Google only provides full texts to the early 1920's,
it seems, but this should improve due to a recent deal they negotiated
with the book publishers.

For some reason, Google Books doesn't work with Firefox
or Opera browsers, but works well with Internet Explorer.

73,
Ed Knobloch

Neil Sutcliffe was kind enough to send me a manual on his GR 783A which
is a more recent version of my GR 583A Output Impedance Meter.  The o/p
xfrmr on my Type O 210 is 10 ohms and I looked inside and saw no
evidence that it was change.  I confirmed that the meter works by the
same technique on my Ten Tec SP 325 which is 600 ohms and it  measured
600 ohms.  The GR 583A is a neat piece of gear, easy as pie to use.

I think that's the Ebay auction number.

You have to watch out for these, as they change their nicknames all the
time as we fill our killfiles with this spam junk.

IET responded that they don't have it!
I got a GR 783A which is newer version and similar but would still like
the 583A.

Why would you care about somebody pointing out an auction that you might be interested in? I don't consider that spam unless they start flooding the group with it.

The unit I have had a broken round meter. I have a replacement which
can be installed.

I am asking $35.00 or best offer. It is located in Clifton NJ.

Please reply by email.
Regards

Richard,

If you are still looking for an old AC-4 power supply, I recently saw
several on the "E" place, and there were a few on www.qth.com as well.
Your choice.

73,
Mike-K5VSE

I am looking for the schematic and (hopefully) the assembly instructions for a frequency converter (6m? or 2m?) kit Model FCV-2 that was sold by International Crystal Mfg. Co. of Oklahoma City. It uses two tubes. I have the kit (NIB) and all the parts - but I don't have the schematic or the instructions. Help? Anyone.
Thanks, Bruce

That's just it.

I've seen these groups totally flooded. Then it goes away for a while and
then the place looks like a classified ad for Ebay again.

Once in a while, fine. But there were some that were doing this
professionally and loading the groups.

Contact ICM!  They still have instruction sheets on some of the modules
they sold in the 1980s.... I would not be surprised if they didn't have
instruction sheets on the earlier ones as well.

What is the front end tube used on this one?

Some locktal tubes had quite low interelectrode capacitance compared to their octal equvalents due to the stem seal base with shorter leads than octals. They were also quite rugged since they were originally intended for automobile receivers and some had less microphonics. Remember, locktals predated miniature tubes but had some of the advantages of miniatures due to the method of bringing the leads out.

Good engineering practice is to use as few variations of parts as possible but Hallicrafters never seems to have been concerned with it. I rather think their philosophy was that people would use a piece of their equipment until the new model came out. One can find a lot of advanced technology in Hallicrafters stuff, like the use of acorn tubes, beam switching tubes, pentode RF power tubes, etc, but often not applied very well.

The Vintage Radio and Communications Museum in Windsor CT, has begun to thin out its excess gear.

This gear is for pick-up only. Images are available from me if you'd like to see them.

The first items are:

Heathkit HW-16 CW rig (Working) $50
Hallicrafters S-76 $40
Hallicrafters SX? (working) $40
Hallicrafters SX-101 $40
Hallicrafters S-120 $30
Hallicrafters S-107 $50 (working)

The ones not shown as working may need some help.

The Museum site : http://www.vrcmct.org/

For the Museum, thanks !
Bob W1CNY

I believe the lone Loctal tube was a 7F8; at least this the tube used in my SX-43. If you want to read more about this particular tube, check out the volume on components from the MIT Radiation Laboratory series. If memory serves, this dual triode was rated to much higher frequencies than any dual triode that had an octal base. These tubes are still available NOS. However, if you are willing to make an adapter or rewire the receiver, I believe a 12AT7 can be used. Of course, if you want "museum quality", which I think is rather foolish, use the 7F8.

    I am looking for an AC4 supply, with or without the
loudspeaker/cabinet. Not much luck at places like Craig's
List or eBomb. Would prefer local to the Los Angeles area
but I am not excuding anywhere. I bought the transmitter
from this group not long ago, the fellow did not have the
supply and they are not supposed to be too hard to find but
I've not had much luck.
    If you contact me via personal e-mail (preferred) you
will get a spam blocker message, return it and I will
unblock you. I am sorry about this but the amount of spam I
get otherwise necessitates it.

hi guys,

well i got my wj355 vlf....it works fine, but i need some connectors & cable. i need a twin bnc polarized connector for audio jack & a triax male 3 lug conn for ant jack. also need a length of twinax cable.(abt 12'). am having a hard time finding cheap bnc's & short length of .25 twinax. anybody out there have any ideas? also would like any documentation for rx.

vlf seems like a new way to keep an old dog busy. hi hi.

tnx, pete,k2iqk

I have some short lengths (three feet or so) with the twin BNCs on them.
Mail me an address and I'll send you a couple.

>
```

> An interesting site. There were more military variations on the Super-Pro than shown, for instance, there was a modification that allowed the use of crystal control for fixed frequency operation. The crystal unit was mounted behind the main tuning dial with two knobs projecting above the dial, one for crystal selection and the other for fine tuning just as in the SP-600. These were evidently used in diversity operation with two or three receivers being linked together.
>
> While most of the drift will be over in half an hour it really takes many hours for the receiver to stablize, perhaps 12 hours. They were meant for continuous operation and will not drift much when so operated.
>
> It has been a puzzle to me that Hammarlund did not use voltage regulators for the later Super-Pro's not even the SP-400, even though they did use them in the comtemporaneous HQ-100 and had the knowledge. The HQ-and its later versions, also had temperature compensation. Perhaps the temperature compensation would have required too much redesign of the very complex tuning unit but voltage regulation would have required little and is easily applied to existing receivers.
>
> Some of the war time receivers, notably the Howard-built ones have some other variations, probably due to shortage of parts. For instance toggle switches are used for the BFO switch instead of a rotary switch. Makes no difference to operation but doesn't look as nice.
>
> One somewhat obscure effect of the high quality audio circuit is that static and interference are less bothersom because the audio circuit is not exagerating them with distortion. Most tube communication receivers have very simple, single-ended, pentode output stages with no feedback. The are big time distortion producers. The difference is easily heard in a direct comparison. For instance, for a receiver like the SP-600 which has a detector output listening to this output on a good quality external amplifier in comparison to the receiver's own amplifier is night and day. Its interesting that the original ads for the SP-600, based on a developmental model, indicate it had push-pull audio. I rather think that the desire to put the entire receiver, including the power supply, on a single chassis required some serious compromises including dropping the push-pull circuit. The two chassis arrangement of the older Super-Pro's allows room for the quite large audio stage, comprising three tubes and two rather large transformers.
>
> Some other receivers of the time also had push-pull amplifiers, notably the SX-28 and SX-32, SX-27, SX-36 and the National NC-100, NC-200 and later versions, and the HRO-50 and 60. Even though the National receivers have rather narrow IF's the lack of distortion makes a difference as noted above. This is not an exhaustive list, there were a number of other receivers with high quality audio stages. Many had a jack for a crystal phonograph pickup in order to get double duty from the audio stage.
>
> The Super Pro is a favorite of mine as you can probably tell:-)

70V PA distribution transformers.

A 70V distribution transformer with an eight-watt input tap will give you
600 ohms input.

Old 70V equipment is usually available free for the asking from your local
installed sound company.

Getting old is not recalling the alternatives offered, so I'm a dummy. I found the filament xfmr first and tried it but it reduced volume so I assume my radio which is non-military doesn't have 600 ohms like the military manual I have. So I guess mine is commercial, either a SP-200-SX or more likely a SP-210-SX and I think it has a 3.2 ohm output transformer.
I can't find any info and I wonder if anyone knows for sure on the commercial models output transformer's impedance.

All of the Super-Pro models from the SP-100 on had 500 ohm outputs for the loudspeaker and a loosely coupled 8K winding for headphones. The 500 ohm output will drive a loudspeaker at much reduced volume. A 12.6V filiment transformer has about the right impedance ratio (100:1) to drive a 4 to 8 ohm speaker from this tap. These tramsformers have enough core material to work down to low audio frequencies and surprizingly good high frequency response. 70V public address transformers also work very well as Scott Dorsey pointed out. The original Hammarlund speakers for the Sp-200, 400, 600, had matching transformers built-in.

The SP-100 has a front panel switch for the loudspeaker but the later versions do not. You need to mount a switch (maybe in the loudspeaker cabinet) to cut it off. Use a DPDT switch with a 500 or 600 ohm resistor switched in when the LS is turned off to provide a load to the audio transformer. It should handle a couple of watts.

The headphone winding is not critical of load impedance and will work with phones from 50ohms to high impedance.

The military and commercial versions of the SP-200 and 210 were identical except for the use of hermetically sealed transformers and chokes and oil filled filter capacitors in the military versions, and some variations of panel finish.

There is an owner's manual for the SP-210 somewhere on the web, maybe on BAMA, I have a copy but don't remember where I downloaded it.

Most of the communications receivers built up to perhaps the 1950s had 500 ohm or 600 ohm outputs. A few even had the output transformer in the loudspeaker cabinet.

Richard
The volume decreased with the filament transformer so I need to open it
up and see if someone made some mods. I downloaded the military manual.
It seems to me that someone at Ham went nuts changing model numbers for
very insignificant reasons.

     Before you do any surgery make sure the matching
transformer is connected the right way around, the 120V
winding goes to the 500 Ohm winding on the RX, the filiment
winding goes to the loudspeaker.
     The output transformer would have to be changed to
provide a low impedance output, that would be pretty
obvious. The headphone output is also brought out the back
on the terminal board.

Note that the military type numbering was not done by Hammarlund. The Super-Pro went through three versions, the SP-100, the SP-200, the SP-400. The SP-100 was available in three versions with different frequency ranges, the SP-400 in two ranges. The SP-100 was also available with or without the crystal filter (I've never seen one without) but evidently the filter could be retrofitted. All three were also available in table or rack mount versions. There were at least two power supplies, a standard and a 50 hz supply. The 50hz supply will work on 60hz but not the other way. The last military versions came with solid state power supplies.

There are some circuit differences between the different frequency ranges. The standard version and the aircraft frequency version (100 to 400khz) have series fed RF stages with some loading on the low frequency range and broadcast range of the standard version to broaden out the RF bandwidth. The high frequency version (1250khz to 40Mhz) has shunt-fed RF to keep the DC out of the RF coils. The coils have ferrite cores so removing the DC sharpens them up a bit, which is needed for a single conversion receiver operating a the higher part of the frequency range. A similar arrangement is used in the SP-400 and SP-400S (the last has the same 1250 to 40Mhz range).

The three frequency range receivers had different military type numbers.

The SP-210 is the same as the SP-200 but came with a 10" loudpeaker, there was also a SP-220, again the same chaissis with a 12" speaker. The standard version had an X on the end of the number (SP-210X) indicating it had the crystal filter, the high-frequency coverage version had an S on the model number as well as the X for crystal, vis: SP-210SX.

The first versions, the SP-100 had glass multi-pin tubes with external sheilds, the SP-200 was redesigned to use metal octal tubes with do not need external shields. Otherwise the circuits are pretty much the same.

The main virtue of the Super-Pro was the band switching arrangement. This is a very complex system of knife edge switches operated by cams, presumably to reduce lead length. National achieved something similar with the plug-in coils on the HRO and the sliding RF box on the NC-100, 101, and later NC-200 and 240 types. This may actually be a better arrangement. Hammarlund caught up by using a rotary turret on the SP-600 and Pro-310. But, except for Hallicrafters version of the Super-Pro, which also has a turret, I don't know of many receivers that used this good, but complex arrangement. One virtue of the Super-Pro is its excellent interstage shielding and lack of spurious responses, probably at least in part due to the RF stage arrangement. It is also a relatively low radiation reciever.

Note that both the sliding coil method of adjusting the mutual inductance of the IF stages (and hence bandwidth) and the type of crystal filter circuit were Hammarlund exclusives. The IF bandwidth arrangement allows symmetrical expansion of the response curve where some other methods cause the bandwidth to expand only on one side. The crystal filter is arranged to vary the Q of the loading coil and, again, does not change the center frequency or gain as the bandwidth is changed, plus it uses a butterfly capacitor to adjust the phasing again so the center frequency does not vary with the notch position. This is a much more satisfactory system than the original Lamb filter used on National and Hallicrafters receivers until pretty late in the game.

I have the civilian version of the instruction book and will post it to you via private e-mail if you can't find it. I am still on a dial-up and its pretty big but its yours if you desire. BTW, it has a long list of the patents used (mostly RCA and Hazeltine Labs) some of which are interesting to chase down.

Richard
Having the dial up goes with the SP, hi hi. I did connect the 500 to the fil xfrmr pri. I was a GCA tech in he air force, worked as a radio and TV tech in high school and college and am a grad engr and have a bit of experience. And I 've had a few SP 600s but this is my first Super Pro 200. 1.25 to 40 Mcs, xtal filter, S-meter and 60 cps pwr supply and stamped Type O after all the patents. It's kind of a neat boatanchor

that I've never played with before and for some unknown reason I keep on
playing with it. I wish it had the full BCB but it's nice on CW & SWL.
After being on all day I don't notice that much drift. It is just about
right on on all the WWVs, but all you know about other frequencies is
the first 2 digits. I don't need the manual as I have a copy of a copy
of copy and the TM 11-866 but neither is really clear on the model
number.
 I was offered $75 at the last hamfest and maybe I'll be lucky and get
closer to the $150.00 I have in it or trade for some other beast.

This is true, it was a very high performance tube.  But it's also true that
after the war a lot of equipment came out using surplus loctal tubes; I have
a Philco table radio that is all-loctal.

Incidentally, Barry.... welcome back.  I don't think I have seen your name
on Usenet for more than fifteen years and it's great to see you here again.

>120 Volt to 12 Volt power transformer. Good at least down to 50 Hz or
>better.

The problem isn't the low end, the problem is the high end.  But the ratio
is about right, and if you pick a good transformer you'll be okay.

Problem is that a lot of cheap transformers have poor core material that
leads to a lot of distortion, and a lot of the better transformers are wound
to specifically limit the frequency response.  For example, the Talema toroids
from Digi-Key are great at 60 Hz, but down 6 dB at 500 Hz and keep falling
above that.   This is a great thing for a power transformer where you don't
want to leak noise into the power line or the other way around, but it's a
bad thing for audio.

But there are a lot of filament transformers out there that are quite
reasonable for audio, and they are cheap enough that you can try a whole
bunch of them and see which work best.

What is the DC resistance across the output?

If you want to know FOR SURE, put the output on a scope with a 1K pot in
parallel with it... tune to interchannel noise, and note the location of
the peaks on the scope.  Crank the pot up until the level is exactly half
of what it was, then measure the value of the pot.

And of course, one commonly written about trick in the old days was to
use a "useless" 400Hz transformer as an audio transformer, the operating
frequency being about where you'd want frequency response to start for
communication use.  Since it moves the frequency up by six, the frequency
response is probably better at the higher frequencies.

That's only a useful trick, though, when 400Hz power transformers are
commonly available, and cheap because nobody can find a use for them.

I am not quite sure of the origin of the loctal base but I think it was Philco. At any rate they made and used them very widely in their radio sets. Philco was a large supplier of automobile radios, I think for Ford. Loctal tubes were supposed to be resistant to shaking loose when subject to vibration.

I have had this unit for years and just now trying to find out more
about it. Made for US Army Signal Corps by Boonton, it is a RF signal
gen 0 to 100 Mcs? with a trigger and pulse width adjustment and
calibrated attenuator, very heavy. I can't find much on it and wonder
if anyone might have any info or the commercial model number..

I have a TR7A that is very weak on receive and will not transmit. The +10T
and +10R lines operate normally when PTT is selected and I press the mic
switch. All receive functions seem to work correctly, but the receive signal
level for even very strong signals is too low to produce any AGC action. If
I back off on the RF gain the S meter does register, so it doesn't look like
an AGC problem. The -5 volt line is only -3.something, but the +24 line and
+10 supply are within specs. The output of the multivibrator / bridge
rectifier for the +24V is within spec as well.

If anyone has seen this kind of problem and can tell me where to start
looking, I would appreciate it.

73,
Bob AD3K

I'm not familiar with the TR-7 but the one area that is certainly common to both receive and transmit is the antenna switching circuit. Perhaps its stuck in some way so that neither the receiver or transmitter is being connected to the antenna.

The civilian operating manual I mentioned in another post is to be found at: http://www.hammarlund.info/hamrmanu.html along with a great deal of other Hammarlund stuff.

I still see PLENTY of 400 Hz transformers coming out of the surplus pipeline today, not to mention 400 Hz motors and brick power supplies. You want some? I think I even have a box of 400 Hz fluorescent light ballasts somewhere. Not even a little bit useful.

Hi,

I'm not familiar with that radio either, but if your -5V line is 2 volts low, there is either:

- Power supply fault.
- Something is loading it down.

If it's modular, try disconnecting the boards one by one until the -5V
comes back up. That'll track it to a module at least.

Cheers!

I haven't tested the impedance yet, need to find a pot, but I noticed
that the two 6F6es are connected as push pull triodes. I wonder why
they didn't use a pair of 45s?

Thanks to a couple of friends, this little KAAR transmitter followed
me home
today. I seems to have been used by the US Coast Guard. The KAAR
brand
vibrator is dated 1943. It's has an original KAAR crystal for 2670 kc.

Here's a page with some photos of it;
http://radioheaven.homestead.com/KAAR.html

Have you ever seen or know anything about this neat little xmitter?
It has it's original shock mount base, but it appears to have had at
one
time a cover. There are shadows on the sides of the chassis where a
cover
was and there are the remains to latches on the ends of the chassis.

73, Ron w4ron

Looks very typical of the design used for the early "doghouse"
FM transmitters made by Motrola and others. That crystal is in
the old marine radiotelephone range, isn't it?

Pete

kaar sold lots of marine and cb radios I serviced this equipment in early
50"s. the kaar cb, with replaceable colored panels were circa 60 plus a
little. 2670 was channel 27A if my memory serves me correctly. I serviced
marine radios and radar on large and small vessels.in the Michigan area from
the soo to Toledo Ohio
 carl, alabama,
by the way still run a very active cb repair shop

It's November and time once again for the Hampden County Radio Assn. annual auction. Admission is free for both buyers and sellers. This auction attracts an attendance of around 100 people year in and year out so don't miss it.

HCRA Annual Auction
November 7th
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

Set-up starts at 6:30 PM
Auction starts at 7:00 PM

10% of the selling price (up to a maximum of $10) goes to HCRA, the rest is yours!

Please mark your items with name, call (if you have one) and a minimum bid. We do the rest.

Too embarrassed to put your name on some of the stuff. Why not donate it? We're not proud, we'll take anything!

A few simple rules:

Please mark your items clearly.
Please, no computer monitors or printers, they just don't sell.
If it doesn't sell you take it home (we can't dispose of things).

Bad economy or not the Giant Raffle returns again this year. For as little as a $5 donation you could win a $250 gift certificate to HRO! Tickets are on sale now and will be available at the auction.

Additional information is on our web site at: http://www.hcra.org or contact:

> Hank

The 6F6 was a much newer tube at the time and is a metal, octal base, tube. It has sufficient plate dissipation and works well as a triode audio amp. The 45 also has 2.5V a filament and is not a heater type cathode, meaning that it needs a DC filiment source for audio use.

Triode audio amps have lower source impedance than tetrodes when used without feedback which is an advantage in driving variable load impedances like loudspeakers, and generally more pleasant overload characteristics. The 6F6 was a good choice at the time and could also be used as a driver.

I ended up with this & it's separate power supply in a package deal,
couldn't buy what I wanted without taking it. It looks better than
average but doesn't have the original S-meter. Both are rack mount
units in cases with a heavy interconnecting cable, and they are heavy!
It covers 1.25 to 40 Mc in 5 bands. Both units have aluminum tags with
serial numbers and the Rx is stamped Type O with a 40,000 serial.
I've heard that they have terrific audio but with only a portion of BCB
it's a bummer.
I'd like to know a bit more about it and if they have any value as
collectors items or are they true boat anchors? Is it a BC-794 A or B
or a SP-210-SX or what? Why did they make the power supply so heavy?
Thanks

I own one. Has little collector value - they made too many. Certainly
a very good boatanchor receiver for AM - in a class with R390,

HRO50/60 IMHO. No product detector so not good for SSB without an add
in prod detector.

The Brits have gone home and with no response I'm still looking for
paper work.

Hi Terry
Got any idea which model I might have?  Back in the 50s when I was a kid
I would have given anything to have one.  And I only saw one real one,
the rest were in pictures!

What do you mean "shame on us?" I took time to report the SOB, did you?

Also, why do you blame it on ham radio? I see nothing NOTHING in the listing that points to a ham.

Get your crap together before doing a similar post, jerk.

Ebay certainly makes it difficult to report things like this. Elsewhere they say to report violations using the "report item" link that is in the item's page. I spent about 10 minutes searching the page for the link. It IS NOT THERE. So went the long way into them and reported it.

Hi, Hank

I meant that the a.c. cord with the metal band around it is adrift
within the cabinet, if the a.c. cord isn't deployed to its full length.
The metal band could have bridged any adjacent tube socket terminals,
or contacts on the selector switches, for instance.

Another shortcoming is that the Triplett 3413-A is unfused,
so the Triplett transformer would probably have smoked
before the line breaker tripped.

73,
Ed Knobloch

It is listed under Ham Radio,You can`t see that?..It`s Illegal ,next
thing will be Counterfit money and bootleg whisky.. I have reported
this activity several times ,nothing changes... From your statement I
believe YOU may be part of the problem,at least willing to ignore
it..This is NOT good for ham radio ..I care about that,You should
too.JERK

You need to improve your reading skills.

By the way, have you advised the FCC that eBay is unwilling to follow-up on
illegal CB sales? No? Why not?

> This is NOT good for ham radio ..I care about that,You should
> too.JERK

I do not see that an illegal sale on eBay reflects on ham radio. It
reflects on eBay and the guy trying to auction the forbidden equipment.

Why are YOU feeling so guilty?

There were three versions of the SP-200/210 made and offered as both civilian and military receivers. The difference was mostly in the frequency range covered. The ranges were:
540 Khz to 20 Mhz, 1250 Mhz to 40 Mhz, and an LF version where two of the bands covered 100 Khz to 200 Khz and 200 to 400 Khz plus 2.5 Mhz to 20 Mhz. The 100 to 400 Khz bands were used for aircraft communication. This LF model is the BC-779, the other ranges had other military designations

(which have now escaped me).

The standard model has resistors in the RF sections of the broadcast band to broaden out the bandwidth and allow for high fidelity reception. I think the BC-779 may have also have these in the two LF bands. The 1250 Khz to 40 Mhz model has shunt-fed RF sections rather than series fed to narrow their bandwidth and improve image rejection especially on the highest band. Other than these variations in the RF sections the receivers are identical.

You may have the 25hz version of the power supply, it has a huge power tranformer and is very heavy. It was intended to work also on 50/60Hz power. Many parts of the world had 25Hz power when these receivers were made (and some still do).

These guys are not collector's items and were made by the thousands. The version you have is the most desirable one as a ham receiver. I think you are not missing much by not having the broadcast band, most AM stations now use so much processing that a wide band receiver will sound very unpleasant.

I used a BC-779 (with 25 hz supply, ugh) as my station receiver many years ago. I tried all sorts of modifications to the RF stages but wound up restoring the original circuits. They are bulletproof and the relatively high receiver noise is of no concequence on the HF bands, especially in the big city. The RX is, however, vulnerable to voltage drift. I installed a voltage regulator for the HF oscillator, otherwise the thing will change frequency as the RF gain changes. With regulation its quite stable.

There is no temperature compensation in the Super-Pro so for good stability it should be run continuously. When that is done, and with voltage regulation, it is surprizingly stable. Because the RX has three IF's and an isolated and amplified AVC the skirt selectivity is quite good and its possible to increase BFO injection without upsetting the AVC. They are actually pretty good sideband receivers.

Don't know if original meters are available. The original is illuminated by a screw base lamp projecting into the meter.

When these were made they were the best receivers obtainable. One military handbook I have in storage somewhere shows comparison charts of spurious responses for several common military receivers c.1945. The Super Pro is very clean showing essentially only one image response. In comparison the SX-28 graph looks like a cornfield.

I have not worked on mine for a very long time but probaby remember some hints and kinks if you ask. Actually, I want to dig it out and put it back in service.

Another note: most of the military Super-Pros were rack mount versions with a shrowd type covering. This is probably good for shielding but has no ventillation so the chassis gets very hot. I drilled perforations in mine, maybe a mistake, but that was more than 40 years ago.

I eventually found a couple of table type rack cabinets for the RX and PS. Because the PS is separate, unlike the SP-600, both will fit into any standard table cabinet.

There are several downloadable manuals for all versions on the web. BAMA is a good place to start but there are higher res versions available elswhere.

Agreed. How in the hell can hams control what somebody sells on ebay?
```

Linears have been used on CB for decades. The FCC gave up trying to police
the CB band ages ago. The proximity of the CB band to 10 meters is
unfortunate, but any hack worth his salt could convert a 15 meter amp to
work on 27 mcs.

Now I wonder if the "alarm" that set off this thread might not be a cloaked
advert of the auction.

Ebay doesn't care.

They have won in court against illegal knockoffs and counterfeit items and is only recently banning ivory due to political pressure, not legalities.

Anyways, why do you care? I know a tonne of DIY'ers capable of making these that would exceed FCC and UL spec and they never had a ham license.

The "Old Boy's Club" is gone, sorry.

Cheers!

This is sadly true. Ebay does take illegal linears more seriously than
most things, but it's true that if a person is a big seller that makes
a lot of money for Ebay they seem willing to look the other way on just
about anything.

>Anyways, why do you care? I know a tonne of DIY'ers capable of making

Oh, I am sure they would exceed FCC specs... by about 996 watts.

Hello and thanks for the read.
I have just received a working Collins 51S-1 that is missing the MEGACYCLES
an REJECTION TUNING knobs.
If you have one or both of these knobs that you would part with, please
reply to me direct. Thanks,
Larry McGee

Well, It seems that most of the Hams are of the same mindset as the
average american public,"Whats in it for me",,Who cares..So ,it`s
illegal ,so what, ...Let me try to explain my position,, I worked hard
to get my license,60 tears ago, I have been able to use it to
contribute a small bit to society,to disaster communications,  ,civil
defense,public service like phone patchs for American service men in
far away places etc,etc...The federal government does not OWE me a
license OR frequencies to operate on..At this point in time, with all
the sattelite and worldwide communications systems that we have in use
today, WHAT DOES HAM RADIO HAVE TO OFFER THAT THE WORLD NEEDS??
NOTHING,NOTHING...How long will we be able to abuse the system and go
un-noticed?   If these bootleggers are allowed to mix their Illegal
junk in with bonafied ham radio , where is it all headed? look
around,You don`t see this.. ,FOR SALE: CB amplifier runs1000 watts on
citizens band,no license needed.You do see this.. HAM AMPLIFIER ,,ON
TEN METERS  , runs 1000 watts output  with 2 watts input...Maybe you
get it,maybe you don1t,,,who cares ,,,,my last post on the
subject   ...W4PQW

There is a LARGE difference between (A) caring that CB is being used as a
illegal profit center and (B) feeling that I should share some guilt for it.

I got my first ham ticket in 53, but I haven't received any entitlement from
that. Do I get points for the length of time?

I feel more responsibility for seeing the illegal CB power Amp seller get
caught because I have a Commercial radio license (55), but I still feel no
guilt for the situation.

It's unfortunate for you that you do not see what ham radio has to offer.

I suspect you spend a lot of time on 2M.

I don't feel any guilt, but I feel a whole lot of shame. I live in a
country where truck stops can hang out a big sign saying "Stop In When
You're Ready For a Big Radio" and CB shops can set up a continuous tape
loop advertising illegal linears on channel 19. This is shameful.

Yes, it's true that you and I can do nothing about it, and the FCC is
unwilling to do anything about it. And THAT is what is shameful.

And the folks that we keep electing into public office don't care. And
that is even more shameful.

I agree, and feel a lot of anger about it. When we have laws, the laws need
to be enforced lest it send a message that says no laws are important,
making matters worse. But it still is not a ham problem.

Oh, no, it's not a ham problem at all.  It's MUCH worse than just that.
--scott

And the discount stores selling touch lamps that flagrantly violate
Part 15 emission regulations are EVEN WORSE.

Then there are laws that are stupid, but no one can vote them down because
they sound too good to be true.  These are the laws that everyone breaks but
rats each other out on until it cripples production to the extent that we
are forced to import!

Rspectfully, what are you doing about it?

If it is an illegal amplifier, you can email Ebay and the F.C.C. with the same email.

Here's a start:

http://www.fcc.gov/contacts.html

I suspect that if both places get the same message then Ebay might just be more interested in setting things right. I've seen them take plenty of Amplifier Ad's down, to the point where some legitimate amps are delisted. IIRC an older SB-200 that would work on 10 meters as-built.

Anyhow, what are you going to do, just tell us how Hams are so awful today, (to which I most respectfully and vehemently disagree) or turn em in? A thought... Just complaining to a newsgroup and doing nothing is the functional equivalent of accepting it and doing nothing

There are bad guys out there. It is our job to root 'em out.

1: Legality, hmm the 'Legality' of amps is purely an arbitrary
decision made by the (laughable) powers that (try) to be.

2: Any half-ways decently built amp, ss or tube, has reasonably clean
output provided it is properly adjusted, the driving signal is clean
and the amp isn't overdriven. I know, lots of conditions.

3: See above answer.

a. See 1 above.

b. Finally a valid point and one with which I am in COMPLETE agreement!

Buily my first ss amp at 14 from a Motorola data book 150 Wo 80 thru
10, my first tube amp from an ARRL handbook, 1983 I think. 500 Wi,
also 80 thru 10. Ya GOTTA love sweep tubes !!

Well, why would anyone have ultimate confidence that it is the same receiver, at all? Sans a record of the serial number purchased/assigned to the project, there is simply no telling. Secondly, the "cyclotron" decal is affixed on top of some chassis blemish not visible of the historical photo. The new-looking, unmolested-by-time decal was obviously installed some time after the blemish appeared, who knows when. Sorry folks, this one would not pass the authenticity sniff test much less pass muster on the "Road Show". de K3HVG

When one gets the "it" what should their feelings be about any amplifier, commercial or homebrew, that covers 10M?

Yours should be a SP-210-SX or BC-794-B (1.25 - 40 MHz)

An interesting site. There were more military variations on the Super-Pro than shown, for instance, there was a modification that allowed the use of crystal control for fixed frequency operation. The crystal unit was mounted behind the main tuning dial with two knobs projecting above the dial, one for crystal selection and the other for fine tuning just as in the SP-600. These were evidently used in diversity operation with two or three receivers being linked together.

While most of the drift will be over in half an hour it really takes many hours for the receiver to stablize, perhaps 12 hours. They were meant for continuous operation and will not drift much when so operated.

It has been a puzzle to me that Hammarlund did not use voltage regulators for the later Super-Pro's not even the SP-400, even though they did use them in the comtemporaneous HQ-100 and had the knowledge. The HQ-and its later versions, also had temperature compensation. Perhaps the temperature compensation would have required too much redesign of the very complex tuning unit but voltage regulation would have required little and is easily applied to existing receivers.

Some of the war time receivers, notably the Howard-built ones have some other variations, probably due to shortage of parts. For instance toggle switches are used for the BFO switch instead of a rotary switch. Makes no difference to operation but doesn't look as nice.

One somewhat obscure effect of the high quality audio circuit is that static and interference are less bothersom because the audio circuit is not exagerating them with distortion. Most tube communication receivers have very simple, single-ended, pentode output stages with no feedback. The are big time distortion producers. The difference is easily heard in a direct comparison. For instance, for a receiver like the SP-600 which has a detector output listening to this output on a good quality external amplifier in comparison to the receiver's own amplifier is night and day. Its interesting that the original ads for the SP-600, based on a developmental model, indicate it had push-pull audio. I rather think that the desire to put the entire receiver, including the power supply, on a single chassis required some serious compromises including dropping the push-pull circuit. The two chassis arrangement of the older Super-Pro's allows room for the quite large audio stage, comprising three tubes and two rather large transformers.

Some other receivers of the time also had push-pull amplifiers, notably the SX-28 and SX-32, SX-27, SX-36 and the National NC-100, NC-200 and later versions, and the HRO-50 and 60. Even though the National receivers have rather narrow IF's the lack of distortion makes a difference as noted above. This is not an exhaustive list, there were a number of other receivers with high quality audio stages. Many had a jack for a crystal phonograph pickup in order to get double duty from the audio stage.

The Super Pro is a favorite of mine as you can probably tell:-)

Why rush? You've likely had it for decades, and keep meaning
to make use of it. Sell it off, and you'll suddenly find a real
need for it, and maybe suddenly regret selling it.

Unless they suddenly find a huge stock in some cave somewhere
on an island in the Pacific ocean, their price is hardly likely
to go down.

At prices like that, I'd seriously consider building reproductions from
new materials and use NOS tubes.

I have for sale a nice original T-368C AM transmitter. It puts out about 500 watts (4-400A final tube) on AM. It's in good operating condition and I'm told it sounds good on the 75 meter net. Physical appearance of about 8.5 - 9, mainly some wear on the edges, but it is on castors for mobility. Electrically it tunes up the way the manual says it's supposed to. I have the full compliment of operator and service manuals for it (all 4 of them) as well as a complete listing of all the small mods you can do to it if you want even better broadcast audio out of it. The optional matching ME-165 thru-line Wattmeter/dummyload goes with it. Just hook up your receiver to the "receiver" antenna connector on the side panel and you're in business. Itlso has provision for muting your receiver as well and it's all built in. This is a nice transmitter that covers 1.5 mhz through 20 mhz continous. Call (979) 696-4400 for further details. It's heavy. Price, $1600.00. Located in 77840.

I have a home brew nicely built AM modulator that is part of an estate that I am helping to sell off. It uses a pair of 811 tubes in the output but I'm not sure exactly what the power rating would be but probably close to the max legal limit for AM (375W). I don't have any pix yet but will get some for anyone interested. If interested you can email me or call Mike at (979) 696-4400. There is lots of other vintage stuff from this estate that has to go too.

Can any one explain the rationale behind using both octal and loctal tubes in the SX-42?

The great majority of hams pass these posts by because there is no interest there for the regular hams. You will find fringe types in all hobbies. This whole thread is a troll to help advertise a shady procuct (no longer listed/probably sold) to a selected defective non-ham interest group.

If you use the item number you can still see the item.

It did not sell.  According to the owner, the minimum was not met, but I see
another story.  His other listings have been pulled, so I think Ebay got
this guy thanks to those who took time to report the illegal auction.

HK> Thanks
HK> Hank wd5jfr

The missing logo is very common in Geloso sets, as common as difficult
to find now. The dialcover is not so rare on eBay, sold mostly with the VFO
kit. I have a couple of new ones but are the 'lab' version, Geloso made
some versions for other brands to be used in lab gears, so, the low
rounded part in the middle has no logo and is squared than rounded
like in this kind of 'rich people' receivers. If you need it let me know.
Also, if you need service notes for this receiver just ask me.
NOTE: this receiver has a point on the chassis to connect converters
for 144 and 430 mhz, often on eBay, they may be used only
with Geloso receivers so they go for low pricing.
The top of the line was the G214, the last 'old school' chassis type,
the G216 was on printed circuit and gave lot of troubles.
The most common troubles in those receivers are located in
the compact tuning box (you have access to it on bottom side); they
usually fail switching, a pain to disassemble to deoxit and for caps
replacing, i may have a new one somewhere IIRC.

Anyone know of any down-loadable eq software that will do in and out on a PC
sound card?
I want to try some DSP audio filtering on the cheap.
tnx
Bob

Yes. However, the original poster should also know about Antique
Electronics Supply, which among other things will sell a modern battery
eliminator to allow you to run farm radios off of AC power.

Does anybody know of a small, easy to obtain receiver that can receive 85 kcs? Tube type, surplus OK.

I have an old Lear ADF that was cut out of a plane decades ago. The cables were whacked off, and I can't find a schematic. Someone did send me a schematic of a set very close in model to the one I have, so I do have that. However, most of the circuitry in the radio is dedicated to the DF capacity, which I don't need or want. There are three subchassis, and probably 15 tubes.

I want to use the small tuning head, which has an 85 kcs IF output, to feed something like a Q-5er that would serve as IF and audio.

If I can't find one, I have an R-11a that I could feed the tuning head output into it's IF strip.

I'm trying to kludge up a homebrew longwave/BCB DX rig.

Hi Bob,

I'm not familiar with Windows apps, but can you rig Winamp to take
real time input from the line in and use its eq? I know XMMS can do that
on *nix and it's a Winamp spinoff.

Cheers,
--
Gregg

Take an AA5. Keep the 455 KC IF strip, but change the tuning on the front
end and the local oscillator.

Otherwise you are probably in frequency-selectable voltmeter territory.

A BC-453 tunes 455 kHz and converts to 85 kHz. The selectivity can be increased by pulling out the plastic inserts. Audio is high impedance, but can be used to feed into another audio amp or back into the receiver audio chain. Lots of info available on the internet. Today, it is easy to build a 24 volt supply, and they like that.

Used to be $4.95 - oh wait, that was 1959. But they are still available.

Build a double conversion converter and you can tune a few hundred kHz. Or build a converter with a synthesized oscillator. Makes a great mobile receiver for your 1954 Buick Special. Build a solid state inverter onto that dynamotor plate. In fact, you can use one of those cheap $6 12 - 120 volt inverters and use a voltage doubler to get the correct voltage.

Colin K7FM

But are they still cheap?

I bought my one and only Command Set transmitter in 1972, for ten
dollars here in Canada. It was actual surplus, rather than bought
from someone who'd bought it surplus.

It's now been longer since I bought it than 1972 was from the end of
WWII.

I have over 100 Heathkit original manuals for sale along with a few
original Drake, National and Yaesu manuals. I will ship international.

The list can be seen here:

http://members.cox.net/radiostuff9/manuals_fs.htm

73 and Tnx for looking,

Ones that have been butchered or modified are still inexpensive.
Modifying a pristine example for a direct IF input would be
a no no; but I've just aquired a few ugly duckings for the IF
transformers fairly cheaply.

Pete

This article has general advice about replacing old capacitors.

http://antiqueradio.org/recap.htm

Vintage batteries are no longer available. Some people make up battery packs
from new cells, or build an AC-powered supply.

http://antiqueradio.org/bsupply.htm

You can also buy a pre-built battery supply.

http://www.radiolaguy.com/ARBEIII.htm

Clean the controls (volume, etc.) using a good electronic cleaner such as DeOxit.

You may get better answers from the rec.antiques.radio+phono forum.

http://groups.google.com/group/rec.antiques.radio+phono/topics

Regards,

Phil Nelson
Phil's Old Radios
http://antiqueradio.org/index.html

P.S. I have a ragged old T-shirt from the Range Hoods, a local (Seattle area) band.

5.3 - 7 MHz ARC-5 transmitter.
AKA Command Set Transmitter

AKA SCR-274-N

AKA BC-458

Transmitter out of WW-II aircraft. Bombers used them. Yours looks to be in reasonable unmodified condition.

Can be sold on e-Bay. If you do that, take photos of the back, sides, inside top and inside bottom (many screws).

Colin K7FM

Thanks for the help guys.

I wont have a use for this so I guess i'll see if I can find somebody to buy it...Any ideas on what would be a fair price to ask?

I Appreciate the help

Serial numbers often start at arbitrary values, I'm not sure why, but
some manufactures seem to like to hide production numbers.

Here is a really nice transmitter...

FOR AUCTION: Extra nice, clean, working CONAR 400 NOVICE TRANSMITTER.

A really fun old tube rig that covers the 80m,  40m  and  15m CW bands
with 25 watts input.

Collector quality - take a look... as of today, only $65.00

eBay auction Item Number:  110299045969

Thanks for looking & 73 !!

Hi,

I just bought a Lampkin 107C Service Monitor.  It has an accessory
that I didn't get.  It's the 20DB attenuator pad (part No. FAP-20).
Does someone have a schematic available so I can build one?  I'd also
buy the unit itself.

Thanks,

Jim

Nothing magical about it, you can find the values for a 20-dB
pi attenuator here:

http://www.electronics-tutorials.com/basics/attenuators.htm

Use 1/4-watt carbon resistors with very short leads. Cushman also used
an external 20-dB attenuator on their CE-3 and CE-5 generators.
They protect the generator from accidental RF being applied to the
generator input. Note that the 20 dB pad also gives a divide by 10
for the voltage scales; it provides a decade step for voltage.

Pete

Its simple. it is done to keep your competition from knowing your real market share, and the uninformed to think you were more popular in your market. OTOH, I have seen single & double digit serial numbers on equipment, including a RGB video switcher for a DEC minicomputer with serial # 00001. Ch 55 in Orlando had serial #16 LaCart Video Automation system at their transmitter site when I worked there, 20 years ago.

20 db pads are common and they are interchangeable - so long as they are designed for 50 ohms. I have seen pads for 75, 92 and 300 ohms, but they are not common.

The pad also makes the input impedance of the device receiving the signal more constant, and is often recommended for that reason. As was stated, be sure to compensate for it.

73, Colin K7FM

Pomona Electronics will still sell attenuator pads.  Or you can make
your own up; the schematic is in the ARRL Handbook.

Also keeps low level noise, mixer products, etc. out of your lab setup.

I built a small unit 20-20-10 with slide switches based on the handbook out
of circuit board, using solder wick to seal the back cover and a short
RG400. About the size of the CE-6 pads. It is said slide switches have
less inductance than others but I don't know for sure. Color TV tuner
cleaner and lube was a great help (blue stuff) with my junkbox switches. It
has come in handy over and over in various applications.

Hello All,

Picked up a very nice Drake 2A at NEARFEST, and would like to pair it up with a nice speaker/q-multipler before sending it off to a friend who has been looking for one (re-paying BIG favor). Does somebody have a good condition 2-AQ out there? Thanks.

David Goncalves

Hallicrafters S-20 (not -R, single tuning knob), very nice with trim:
$100

Medium-High Power Homebrew Balanced-Line Tuner, uses aligator clips on main coil, 80-10 meters: $50

HW-101, cosmetically VERY NICE, with rebuilt HP-23 power supply, new parts and dial, good tubes, but low sensitivity. Includes parts rig: $150

Shipping extra, carrier of your choice, pickup and delivery might be arranged, QTH is Lexington, MA

It's November and time once again for the Hampden County Radio Assn. annual auction. Admission is free for both buyers and sellers. This auction attracts an attendance of around 100 people year in and year out so don't miss it.

HCRA Annual Auction
November 7th
Feeding Hills Congregational Church
21 North Westfield Street
Feeding Hills, MA 01030

Set-up starts at 6:30 PM
Auction starts at 7:00 PM

10% of the selling price (up to a maximum of $10) goes to HCRA, the rest is yours!

Please mark your items with name, call (if you have one) and a minimum bid. We do the rest.

Too embarrassed to put your name on some of the stuff. Why not donate it? We're not proud, we'll take anything!

A few simple rules:

Please mark your items clearly.
Please, no computer monitors or printers, they just don't sell.
If it doesn't sell you take it home (we can't dispose of things).

Bad economy or not the Giant Raffle returns again this year. For as little as a $5 donation you could win a $250 gift certificate to HRO! Tickets are on sale now and will be available at the auction.

Additional information is on our web site at: http://www.hcra.org or contact:

Jim Mullen, KK1W
144 Tower Hill Road
Brimfield, MA 01010
413-237-4666
kk1w@charter.net

See you there!

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 19th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

I just watched a movie called "Across the Pacific" (1942) with Humphrey Bogart and at the end of the movie there was a hallicrafters SX-11 or 12 in the scene where they are at the plantation. A lot of old Bogart movies have cool radios in them. I've also seen a SX-42 in "Sabrina" and a Hallicrafters marine radio phone in "Key Largo" .

Hallicrafters stuff seems to have been popular as props. I've seen S-38, S-40, etc., in various films particularly from the late 1940's and 1950s. Perhaps this was due to the art deco cabinet designs. Hallicrafters seems to have been aware from a very early point that appearance and features sell even when performance may be mediocre. Its also possible that their promotion people may have "placed" H equipment in movies.

I don't know if the pad is quite similar to that used on the CE-3 or
not, but if it is,
I have one of them, and could take it apart (again) (again) and (again) to

draw
a schematic. The CE-3's pad included a micro fuse to protect the CE-3 from
transmitter output. I've tested the fuse system a number of times, and
replaced
the resistors a few times as well. This happened quite often in the wee
morning
hours on the bench after 16 hours or so trying to make sense out of some
newfangled solid state transceiver.
     If you think it'll work, I'll draw a crude schematic and e-mail it to
you.

Old Chief Lynn

Sure, there are some Hallicrafters radios in the Hollywood A movies. But it
seems like one out of three of the cheesy low-budget sci-fi movies from the
50s had at least one. One of the journey to the center of the earth movies
had two, one modified with a piece of paper to serve as an indicator of the
mileage from the earth's surface.

There's a 50s Dragnet episode which shows a s-38 stacked on top of a S-40.
At the time I saw it, I had my radios stacked the same way -- more than
fifty years later!

Oh, the boatanchor tradition in films continues on and on. Even on TV,
too. Watch episodes of Alf where he uses a Heathkit product to contact
his home planet.

>There's a 50s Dragnet episode which shows a s-38 stacked on top of a S-40.

It's a good combination.... much nicer than that Heathkit.

Oh, and if you like military boatanchors, watch Mission to Burma. Lots of
different field radios on display, from the PRC-6 on up.

You can see command sets in several WW II movies. I recently saw
12'o Clock High and there is a brief scene where they are shown in
a rack. Of course the movie was made in 1948/9 when there were
still a lot of flying B-17s as orignally equipped. After the war, a
lot of those got converted for ham use. In the Mid 1950's a buddy had
a command set receiver which he and I used as Novices in the
Sweepstakes contest.

Trying to do the Sweepstakes on crystal control in the Novice bands,
of course presented its own set of challenges. We did much better
the following year when we had a new Hammarlund and a transmitter
with VFO control.

Jon W3JT (but KN9CAH/K9CAH in those days. My buddy was K9DGE,
now W6BSF.)

How do you convert a B-17 for ham use?

You make sure the equipment works on the ham bands, and if
not, put in ham equipment, making sure there is a suitable
power supply to run off the presumably 400Hz AC already in
the aircraft. You'd also need a pilot's license, and given
the size of the thing, and wanting to operate the radios,
likely you need someone willing to be the pilot while you
play with the radios.

It might make a good club project. There used to be articles
about various ham clubs converting trailers and even milk vans
into stations for remote operating, field day and public service

and even emergencies. That way you get the labor to do the
restoration, and share the costs, and get enough "staff"
to keep the plane going and in the air.

I can't picture a B-17. Was it a common one, or one that
was so large that they never made many?

I can imagine if it was a common plane, that after the
war many did land in private hands, and given how cheap
surplus was, maybe even a ham did have one at one point.

The B-17 Flying Fortress was one of the most successful bombers of WWII.
Almost 13,000 were built.

Michael;

No, it wasn't to common. They only made 10 or 15 thousand of the things
before they became obsolete and were scrapped.

Seriously, the B-17 was known as the Flying Fortress and was used
extensively by the 8th US Air Force during WW II. Other theaters of
operation also saw the B-17 but to a lesser extent.

As for a Ham having a B-17 I guess that Gen. Curtis Lemay of the
Strategic Air Command qualifies. He used his personal SSB transceiver as
a proof of concept radio to demonstrate that world wide communications
could be achieved using SSB. He operated all the way across the Atlantic
Ocean from North America to England with out loss of communications with
Offet AFB using SSB. Using AM radio this was impossible under normal
operating conditions. The USAF still uses SSB for it's long distance
comms, at least when it is not using satellite comms.

Sic transit gloria mundi! The B-17 "Flying Fortress" was a very famous aircraft, a heavy bomber used extensively by the USAAF in the European theater. It, and the B-24 "Liberator" were the backbone of the air command operations. There are examples of both in flying condition still in existence. Worth looking at if they come to visit. No creature comforts whatever and air crews often spent most of their time in them. Both aircraft were built in very large numbers and had reputations for being extremely rugged. Original radio equipment was minimal and much of it still exists and some is in use (on the ground) by amateurs. Most WW-2 aircraft were unceremoniously scrapped after the war. It is now difficult to find examples of airplanes built in quantities of many thousands.

I need a circuit and wiring diagram for ARC-38 250 kHz IF amp part no.
540 9964 903. This is to go into a 618S, airline ver. of ARC-38. My
example has a couple of broken wires and it's not at all obvious where
they go. This module differs from the 618S ver. in that it has 2
mechanical filters, 1 of which is a narrow filter (2 kHz) for CW.

Thanks,

John Mackesy VK3XAO

In the sherrif's office in Eureka (sci-fi channel), there is some sort
of old radio. I never see it well enough to even guess what it is,
but someone who knows what it is might recognize it.

Over the three seasons, the microphone changed, I think early in the
first season, it went from a hand mike to a desktop.

Geoff.

Hi,

807 == 6L6 for RF in a 5-pin socket.

Or do you need a 6L6 specifically?

Frequency would be helpful as I have some 6L6 for guitar amps I can test
for suitability.

Cheers!

I've used the cheap eastern block 6l6's on 40 & 80m without any
problems, if you need to use the higher bands you would be better off
using a 807 (same valve but with a top cap anode)

http://cgi.ebay.co.uk/10x-Tubes-6L6_W0QQitemZ300266924970QQcmdZViewItem?
hash=item300266924970&_trkparms=39%3A1|66%3A2|65%3A1|
240%3A1318&_trksid=p3286.c0.m14

Far better quality than the new production Chinese version.

Steve H

Check the datasheets and pick the one with the lowest interelectrode
capacitance.

The higher power ones (like the Sovtek 6881WXGT) will probably tend to
have higher capacitance because of the larger plate area.

Hello,

My first REAL HF radio was a Hallicrafters SR-150 and was wondering if "ANYONE" had one they are thinking of parting with? Of course I would want it with the A/C power supply.   *MAYBE* we can work out something.
Please advise.

Tnx & 73,

Rick WK4R

Jeez, if I had an HRO 7, I wouldn't need to do this to begin with! LOL!

I'm going to use the Lear tuning head to feed the 85 kc IF of the R-11a. My
big problem will be voltages. The R-11 uses 14 volt tubes, wired in series
pairs. That was for the plane's 28 volt system. I'll have to rewire them in
parallel and feed them 12 volts. I haven't looked at the Lear yet, but it
probably uses the same idea.

Weren't R-11's fairly common? A Google search turns up only one page on the
entire Internet that even mentions them. There are a couple of the Lear
tuning heads on eBay. That surprised me.

While you're rewiring the heaters consider replacing the metal-cased
caps under the chassis. They will have to be removed to access the
tube socket bases.

An alternative to rewiring the filaments is to build a power supply
using a 24 V transformer. My Q5-er supply uses back-to-back 25.2V
transformers to feed the rectifier/filter circuit. The filament
voltage is taken from between the two transformers. A 6.3-0-6.3V
transformer supplies 6 & 12 volts.

Sorry, I should have given more info. This home-brew CA
(Canoe Anchor) covers 40 thru 10M, CW and phone and runs 400 ish
volts on the plate. There are space limitations, height including
envelope and base con't exceed 3 inches max and envelope diameter
can't exceed 1.65 inches due to cabinet restrictions.

Would LOVE to use an 807 or 6FL6 or similar but I just don't have the
room.

TIA

Aren't most 6L6 variants taller than 3" by a good bit?

If I'm going to use the remote rotatble ferrite bar antenna (and I
definitely want to) I'm going to need 28 VAC 400 Hz. Does anybody know of a
schematic for an oscillator circuit? I looked online and couldn't find

anything.

I saw an eBay listing for a Lear ADF. It looked surprisingly like a Bendix T-12B, also known as an ADF-201B. This particular model has the tuning dial right in the center of the front panel, and it is a solid state unit. The only difference it that the Bendix unit uses a 140kHz I.F. I do have service information for this model.

Uh, oh..........we are talking about a different radio than the Bendix unit.

Hi,

You might try a 5881 tube. It's shorter than the normal 6L6GC's.
5881 seated height is 2.9"
Height including base pins is 3.938", diam 1.438"

I would buy a new old stock GE or RCA 5881,
in case the current production
imports are not suited for rf, since production is now aimed
at the electric guitar amplifier market.

The 5881 has 23W max plate dissipation. The original series
6L6/ 6L6G/ 6L6GA/ 6L6GBGB had 19W max plate dissipation,
and the 6L6GC had 30W.

73,
Ed Knobloch

The ARC book shows the 12-24 volt re-wire options.  The Type 12 system,
of which all that series is part of, was designed for both voltages.
Its not difficult, at all, to swap a few wires to change the voltage.
If you need the sheet, I think I can scan it into a TIF.

If the folklore passed on to me in about 1965 is correct, Motorola bought the Lear ADF design and made it the ADF-12. Bendix got the design from Motorola and came out with the ADF-T12-series. There certainly are striking similarities as one might expect. Tye worst of the lot is/was the synthesized ADT-T12D. It is an abomination. We took the "D" out of our aircraft and re-installed a "C" model.

I've seen HRO's for less than $50.00 at hamfest without coils! The VLF
coil might be hard to find but you'd end up with less stuff and less
work!

Hi Hank. You're right, but I've never seen a set of LF coils for the HRO despite seeing (and owning) several HRO's. Then you need to factor in the expense of the additional room you have to build to house the thing, seems terribly expensive to go to all that trouble to replace a DBM, a low pass filter and a one transistor crystal oscillator to build an up converter. Use whatever you've got for the IF.

Hi Harold
My way is travelling a random path and finding whatever is fast, cheap
and available because if I look too long the urge soon goes away. There
are too many distractions along the path, and at times create a greater
urge. So one has to drop the lesser urge and pursue the greater urge.
It too, can be sidelined.
Another options is a frequency selective voltmeter, they used to be real
cheap but now not so because I think the VLFers have their eyes on them.
I still see the odd one at hamfests for about $20.00.
Yes I agree that a transistor osc. or a 6BE6 would do the trick.
I kept one HRO for sentimental reasons and to waste gravity and
somewhere in a box I have stored some odd ball coils. I'll have to see
if I have LF. I might because interest in LF and VLF is one of my
chronic diseases that is currently in remission.

WOW! I have a HP-312/313 pair that I paid a couple hundred for, but I
wouldn't let them go for twice that.

> Yes I agree that a transistor osc. or a 6BE6 would do the trick.

>
If I want to use WWVB, I can use the 312 (With a surplus filter to keep the
59 KHz from the video monitor 2 floors away out of it) or a little TRF/PLL
RX I built for that maybe 20 years ago. Interestingly, my loop, (100 turns
on a 32 inch bicycle rim) resonates at 60 KHz with a big ARCO trimmer, but
resonates right at 24 KHz for NAA with just a alligator clipped on 1890 pF
silver mica. I monitor that with a simple DBM/crystal oscillator (with a 96
KHz oscillator and a divide x 4 74AC74). Lots of signal. I used to monitor
with an old Rustrak paper tape recorder, but a few years back, Radio Shack
had a special on for Metex Voltmeters that had an RS-232 output and a piece
of software that would send a reading to a file on the computer. Now I just
throw away the parts of the file that are uninteresting and save the SID's.

Interesting part of the spectrum, I also did a BC-453 conversion solid state
and to 136 KHz several years back, that was a learning experience but not
terribly interesting.

Making coils for the HRO is not too big a deal as long as you don't need them
to look original.

Hi,

If you can't submount the octal socket, even a 5881 won't fit.
Have you considered a pair of 5763 9 pin miniature

transmitting tubes in the final? Each has 12W max plate dissipation,
so a pair would be rated for the same power as a 6L6.
They are small, so not as forgiving of an overload, though.

An 8121 tube would fit easily, but it requires a 12V heater,
and the sockets can be expensive. It's finned for a transverse
blower, but at 400V class C, it might not need a blower.
I've bought 8121's on ebay for around $10, a bargain
compared to the pricey 8122, which is the same tube
with a bigger plate dissipation rating (and which requires
through-the-socket cooling).

If you are willing to pressurize the chassis, a 4X150A
or 4CX250B would fit fine, but your blower might be as large
as the rest of the rig.

73,
Ed Knobloch

On 160M, you should be able to get more power out of a 6L6 than a single 5763, but by the time you get up to 20M, the 5763 will be putting out a good bit more than the 6L6. The shunt capacitance on the 6L6 kills you.

The 8121 is a really cool gadget, and ten bucks is hard to beat. It is surprisingly rugged, and if you only want to run HF you can make your own socket.

>If you are willing to pressurize the chassis, a 4X150A
>or 4CX250B would fit fine, but your blower might be as large

Last time I used a 6L6 as a final, I had to submerge the whole chassis in transformer oil to cool it down. I was getting less than 2W on 10M with the plates glowing bright red. That was... well... a long time ago....
it seemed like a good idea at the time... and it worked great on 80M!

A while back I bought a Radio Frequency Labs 459A Crystal Impedance
Meter with a range of 0.8 to 15 MC. I think the military version is
TS-330/TSM. I really want to try this thing out but need a manual or
instructions, and a schematic if it isn't working. I've already got too
much into it to spend another $30.00 for a commercial manual. I've
Googled for free manual and can find nothing.   Anyone have a PDF or a
manual they want to sell cheap?
Thanks

That explains why the old T-12B that I had was a Motorola unit. All of the T-12Cs (I have five of them) are Bendix units. I did have a T-12D a while back. What a brick! I bought it, along with a batch of KR-85s from one of the local airports. I kept only one of the KR-85s.........not a bad radio, but those bandswitches take a bit of time to clean.

Hi, Gang

I've owned a Triplett 3413-A emission type tube tester
for more than 30 years, and I always made a practice
of pulling just enough a.c. cord from the panel
of the unit to reach the outlet, leaving the remainder
of the a.c. cord hidden away within the cabinet.

I can't believe how lucky I was that nothing shorted out.
I had occasion to open up the unit to correct the a.c. "line"
meter reading, and I noticed that the "stopper"
attached to the cord which keeps the a.c. cord
from being pulled too far out of the cabinet
is actually made of metal. By leaving unneeded a.c. cord
within the tube tester cabinet, the metal "stopper"
could have shorted anything out, damaging either
a tube under test or the tube tester itself.

73,
Ed Knobloch

If you have a lot in it, all the more reason to spend more on a manual.

In "Some Like It Hot" with Tony Curtis, Jack Lemmon, and Marilyn Monroe, the character Osgood is shown making a ship-to-shore call from his yacht to the hotel using a Hallicrafters S-20R.

http://antiqueradio.org/art/halli1023.jpg

Ridiculous, of course, since the S-20R is a receiver, not a transceiver. His telephone handset is plugged into the headphone jack.

I have also noticed the SX-42 in "Sabrina."

P.S. Also ridiculous because the S-20R wasn't introduced until 10 years
after 1929, when the movie is set.

I'm not really sure you shouldn't be able to operate the thing without
a manual... it should have a test oscillator inside, a meter, and a place
where you put a crystal.  Insert the crystal, then swing the oscillator
back and forth until you read the resonance point on the meter.

Some models out there required an external oscillator.

See if you can get a manual for an AN/TSM-15.  That should give you at
least the basic principles of operation for the things.

Talk of ridiculous, there is an old movie that has a German WW2 U boat
with a British Admiralty B40 RX on board.

http://www.armyradio.co.uk/arsc/customer/product.php?productid=1540&cat=7
2&page=2

http://tinyurl.com/5fl9xr

Apart from being British it was also a 1950s radio!

In "Father Goose", staring Cary Grant, there is what I think is a Hallicrafters S-22 on the yacht in the beginning of the movie.

http://www.youtube.com/watch?v=C-F3vSrJIUQ

There is some more radio equipment later in the movie, in the island hut, that I don't recognize.

http://www.youtube.com/watch?v=hhvurJws-bo

Great movie!

Jeff

I was at the Newport (south Wales) radio rally tihs weekend. On an impulse I purchased a Hallicrafters S-118 for �20 (about $40). I don't have any valve equipment, so I saw it as a way to get something to play with.

When I got it home I took off the cover. An additional transformer had been added above the chassis which was configured as an autotransformer to transform 240V to 120V, as required by the original transformer (but it was a bit of a beast). There also had been some modifications to the antenna connections to bring them more uptodate, so I was worried at what else might have been fiddled with.

I also did quite a lot of googling to find out more about the reciever. I was surprised to see that the radio dated from the early sixties - just like me! I really like the large tuning dial which seems much more modern than it's true age. When I looked at the build quality I thought that it was quite sloppy/poor, and I even wondered if what I was seeing was later modifications to replace older components, but I have come to the conclusion that most of what I see is original.

I found a service manual on the BAMA website, but the schematic was virtually un-readable. If anyone knows whether a more clearer schematic is available freely on the net, please send me the link. Perhaps another model has a similar schematic, if so please post details. I am particularly interested to understand the HV power supply and heater voltage. The schematic just about lets me see that the heater winding of the transformer might be 12V and that the secondary voltage appears to be doubled by two diodes. I either need to find a way to transform 240V to 120V with a smaller transformer than the one which was added, or I need to replace the original transformer with a UK equivalent.

I am really looking forward to carefully checking out the reciever and getting it operational again. Any advice would be gratefully recieved.

73 de

Dave
Thanks for the tip on Cooke in England, I've asked them for a delivered
price.

Someone recently gave me a cute little SWAN SWR-1A dual-meter, but, beyond connecting xmtr and antenna or dummy load, I don't have the slightest idea how to operate it. It has NO switches and only one knob and a mark labeled "set" on the power meter.

Is it so simple that I should not NEED instructions?

Hi Myron;
I have the exact same meter, nice & small.
I just fooled around with it until I got the procedure right:-)
Just put in X amount of power & adjust the knob until "Set" is
reached, then read the SWR on the right-hand meter.
While its ok for SWR, the actual wattage readings will not be that
accurate.
These meters were high quality made for Swan, in Japan.
I have seen many other exact ones with different brands.

I do have the tag for the 390a. It was removed for some reason a while back.

Thanks,

I've been getting a lot of questions so I will clarify...

You get 4 radios. 1ea r390, 1ea r390a, 1ea sp600, 1ea sx-28 for 1200 dollars. At this time, I will not split them up. You have to come get them in the middle, ga area. I will not ship.

Thanks,

Tracy Fort

This AM synchronous detector was described in Fall 1994 issue of Comm Quarterly. I bought parts for two of these and this sale is for the 2nd partial kit. The heart is the Motorola MC13022 AM stereo decoder chip. I am selling: The FAR Circuits Board, Motorola IC MC13022, LM311 IC ,The shielded variable inductors, Tantalum caps, PC mount test points, Copy of the article. The remaining parts are generic transistors (TWO 2N3904), caps, resistors etc. $35 shipped CONUS USPS

Hi, Bill and thanks for the reply.

Well, when I was a kid, I really wanted one of these things. Didn't have
the money so, I built a 6L6 rig.

Now that I am a big kid and retired (still no money), I would like to putter
with one.

How much?

Joe

Greetings all,

Sorry for posting here as this is not quite a boat anchor, maybe a
paper weight, but I am in need of a service manual for an old Icom
IC22 VHF rig. I have the owners manual, but if someone out there has
a service manual, if one ever existed, please contact me. A free bee
would be nice in .pdf format.

EMAIL to me @ n9vu at hotmail dot com please.

Thanks, and 73 de,

Gary/N9VU
